Next Issue: Commodore, Too!

Introducing the first word processor made especially for the home

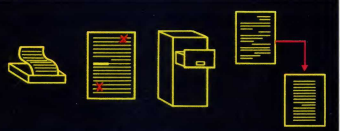
HOMEWORD™

The Personal Word Processor

1. **A POWERFUL WORD PROCESSOR**
   * helps you be the best writer you can be
   * at a fraction of the price of most others
2. **EASY TO LEARN**
   * audio cassette guide to the basics
   * instructions written in plain English
3. **EASY TO USE**
   * pictures illustrate your choices

TYPING AREA

VISUAL MENU



ENTIRE PAGE DISPLAY

HomeWord makes writing easy. Changing what you write is even easier. Since the commands are illustrated right on the screen, you don't have to memorize any complex codes.

Yet HomeWord's simplicity is deceptive. Although easier to use, it offers you the power of more expensive word processors!

Yes, HomeWord is the best buy for your money. . .and the best money can buy! HomeWord is available for only $69.95 on the Apple II, II+, IIe and Commodore 64. Coming soon on the Atari!

Features Include

* add, move and erase blocks of text
* automatic outline indents
* underline, boldface, upper and lower case
* reliable storage and retrieval of all your files
* automatic page numbering
* print documents of unlimited length
* universal search and replace
* easy view of movement through your files

Sierra ON-LINE™

Sierra On-Line Building • Coarsegold, CA 93614 • (209) 683-6858

Which player is winging his way to victory?

When Joust* flies into your living room you might think you're in the arcade. Because, just like the arcade, this Joust is a duel to the finish. But remember that some jousts are worth more than others. The knight on the right, for example, is about to score 500 points for lancing a red Bounder. But the knight on the left will score three times as many for skewering a blue Shadow Lord. That ought to needle his opponent.

You can spear yourself a lot more points. Especially in the Egg Wave. Pick up as many eggs as you can before they hatch. The first egg's worth 250 points, the second 500, the third 750, and the fourth 1,000 points.

Only Atari makes Joust for the ATARI® 2600™ Game, Sears Video Arcade† systems, and versions exclusively for the ATARI 5200™ SuperSystem and all ATARI Home Computers.

So mount your ostrich and descend on your nearest store. For Joust.

Hi-Res MAGAZINE™

933 LEE ROAD • SUITE 325 • ORLANDO, FL 32810 • (305) 629-4567

Dear Reader,

As you can see by our cover, Hi-Res Magazine is set to take a bold step forward by adding coverage of Commodore, in addition to our already full coverage of Atari!

Both manufacturers continue to produce computer systems that merit the finest coverage and support. Hi-Res is committed to fulfilling this task. We plan to bring you honest and critical coverage of both systems so that you, our readership, will have the opportunity to compare, in one magazine, the good and bad of Atari and Commodore hardware and software.

This magazine started with the concept of single support for the Atari line. But in our short existence, the reality of Commodore's impact on the home computer market could not be ignored.

Also, Commodore has more than proved itself with sales peaking 2 million for the Vic-20, more than 1 million for the Commodore 64 and at least 100,000 modems.

As we hit the newsstands, Commodore probably has introduced to the consumer its new computer — codename TED. At presstime, we were told the computer's formal name would be Model 264, but its expected retail price remained in question.

Our sources explained TED will have a full keyboard and the same graphics as the 64, but without the *sprites*, those little moveable graphic blocks which are called *players* on the Atari. It also appears TED will contain 64K of memory.

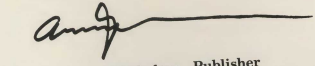
The 264 also should be compatible to all existing Commodore peripherals.

This third issue of Hi-Res also introduces our new editor, John Babinchak II, and I'm sure you will agree after reading the magazine the programs work and the product is more pleasurable to digest.

My apologies for the programming mistakes in our Premiere and second issues. Now, we have our act together. Looking through our letters to the editor — some of which we have published in this issue's Back Space department — we received both complimentary and negative comments by you. Please believe every letter and card is read by each of us and considered top priority. Continue to "sound off"!

Thanks for your support and making Hi-Res a part of your family.

Sincerely,



Anthony J. Nicholson, Publisher

Preppie! II
Adventure International
Longwood, FL
16K Cassette
32K Diskette
$34.95

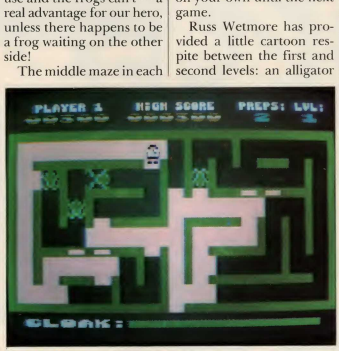
by Steve Harding

"Up and coming prepster Wadsworth Overcash had the world by the tail until a failed Freshman initiation banished him to the tender mercies of the cruel Groundskeeper. Forced to recover wayward golf balls on a course of hellish design, Wadsworth barely escaped with his Lacoste intact. Now, the saga of Wadsworth Overcash continues as he faces his greatest challenge yet in — *Preppie! II!*" So begins the manual in the latest installment in Russ Wetmore's delightful *Preppie!* series from Adventure International.

Preppie! II is far different from *Preppie!*. In *Preppie! II*, our hero finds himself once more in the clutches of the evil Groundskeeper. This time, the golf ball retrieval motif has given way to a paintbrush, and a plethora of "Preppish" colors with which Wadsworth must paint the floor throughout a series of mazes. There are five levels with three different mazes in each level. The object is to paint the entire floor in each of the three mazes.

Sounds easy so far, right? Not so. The first and third maze in each level are inhabited by radioactive frogs that will search out our hero and leap on him, given a chance. Each of these mazes also has a pair of revolving doors that Wadsworth can use and the frogs can't — a real advantage for our hero, unless there happens to be a frog waiting on the other side!

The middle maze in each



Preppie II

level should look familiar to *Preppie!* veterans. The lawn mowers and the golf carts are once again out in force in an attempt to "raze" Wadsworth's hopes. These mechanized dangers move horizontally and at varying speeds, making avoiding them all the more difficult.

Wadsworth has one advantage — The Cloak Effect. Pushing the joystick fire-button renders him invisible for a short length of time. The Cloak Effect also makes our hero impervious to radioactive frogs, lawn mowers and golf carts. The amount of Cloak Effect available is shown by a bar at the bottom of the playfield. But use the Cloak Effect sparingly and only when you've painted yourself into a corner. Once the Cloak Effect is gone you're on your own until the next game.

Russ Wetmore has provided a little cartoon respite between the first and second levels: an alligator chasing Wadsworth across the screen. Then Overcash, swinging a hammer, chases the alligator. As for other between-level surprises, you'll have to discover them for yourself. Level three is as far as I can go for now.

Mark Murley's documentation is almost worth the program's suggested retail price of $34.95. It is well written and humorous. You can play the game without reading the manual, but do read it. It's quite good.

In sum, Adventure International and Wetmore are to be commended for a job well done. I can hardly wait for *Preppie! III!*

Chess 7.0
by Larry Atkin
Odesta Corp.
Evanston, IL
48K Disk
$69.95

by Murray D. Kucherawy

"Chess, like a beautiful woman, has the power to make men happy." — *Tarrasch*

For most chess players computerized games are disappointing. The principle reason is that a challenging mental game requires a lot of time.

Most computer chess games reflect that time in their lack of speed. Such lack is understandable since a programmer is faced with nearly unlimited possibilities in the first 10 moves of a chess game.

One of the latest efforts is Chess 7.0 from Odesta Corp., which shows improvements in time delays and has other chess "goodies." You can challenge your computer at any one of the 15 skill levels — some of which are "thinking-time limited" levels and others which are "depth-of-search limited."

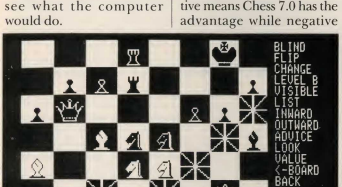
Chess 7.0 thinks about its next move while you're thinking about yours. If your move was expected by the program, the response is quite fast and, if you're impatient, you can hit return and Chess 7.0 will respond with the best move it has found so far.

The author of Chess 7.0, Larry Atkin, is a member of

the programming team that produced the famous and very successful Northwestern University chess programs, which have won several international computer chess championships. They also have placed highly in tournaments where they played against humans.

I have a secret test I apply to chess programs to determine how strong they are. Several years ago I played in a tournament in which I spotted an intriguing possibility involving the sacrifice of my knight. I studied the position intently and finally made the sacrifice. A few moves later I won the game. There was controversy afterward as to whether I really had won or my opponent had simply been unnerved and then had blundered. Nonetheless, I was awarded the "brilliancy" prize for the tournament.

After that, whenever I wanted to test the playing strength of a program, I would — behind closed doors — set up the position, make my sacrifice and see what the computer would do.



Chess

I applied this test to Chess 7.0. Modesty keeps me from discussing the results, but that Chess 7.0 has my respect.

In this chess-playing game, which will provide years of enjoyment for any chess player, there are several built-in functions that make Chess 7.0 a teacher as well as an opponent.

It plays the opening moves by referring to its internal "library" — a stored collection of moves and responses which have become recognized as strong openings through decades of tournament play. There remains a random element in move selection so each game will be unique.

If you're stumped for a move, you can ask for advice and, at most levels, Chess 7.0 will make a suggestion. It also will show you what move it will make if you take its advice. If you ignore its advice and blunder, the program allows you to take back the move (or any number of moves right back to the beginning of the game). You also can peek at what move the program is considering for itself in any position.

Think you're winning? Call up the value function which will display a positive or negative number. Positive means Chess 7.0 has the advantage while negative means you're ahead and the size of the number indicates how strong the advantage is. You may see "MT3", meaning you will be mated in three moves.

Has your wife called you for dinner for the third time? You can save your game to disk. Got a losing position? You can switch sides with the computer.

Flip Flop

Want to play with a friend? You can use the chessboard on screen and Chess 7.0 will be the referee watching for illegal moves on either side, ready to take over for either player. This feature is also handy for studying the instructive games published in chess columns and magazines.

A very attractive and complete manual is included in this package. Not only is each option explained in detail, but rules, strategy and lore are discussed for the benefit of the novice.

In summary, this is a superlative product surpassing all current chess-playing programs available for microcomputers in speed, playing strength and versatility.

Flip Flop

by First Star Software
New York, New York
Atari 400/800/1200 Disk
$29.95

by Mark S. Murley

horizontal scrolling hit the coin-op market like a right cross from Mr. T. Then, somewhere at a stockholders' meeting, some corporate demagogue must have leaped from his chair and cried: "Hey, there are girls out there with quarters, too! Gimme cute!" Thus, *Pac-Man*, *Centipede*, *Donkey Kong*, and other basically non-violent games were birthed. The cutesy approach to video gaming was in full swing.

Now, the 3-D look is in. If you don't believe that, grab your calculator, saunter down to the corner arcade and start counting the coin-ops that at least go through the motions of a 3-D look and feel. *Zaxxon*, *Sub-Roc 3-D*, *Buck Rogers*, and *Star Wars* are a few that I can think of.

Of course, the promise of true three dimensional graphics on your home computer is sham. What they're doing is shifting the perspective, in much the same manner that you can draw a square from an angle and give the appearance of depth. It's a nice change of pace, though, and there are a few games currently on the market that milk the shifted-perspective cow rather well. Which brings us to *Flip Flop*, from First Star Software.

First impressions stick, and the first impression one gets upon seeing *Flip Flop* is that the guy who designed

Game concepts, like hemlines, rise and fall with fadish regularity. Three years ago,

it probably spent his summer vacation stuffing quarters into a *Q*Bert* coin-op. But before you sneer, consider the recipe which was prepared so effectively by *Preppie!* author Russ Wetmore: Take the basics to one proven arcade game (*Frogger*), add a liberal reworking of the theme, and garnish generously with originality. Voila! One sure-fire hit.

The action in *Flip Flop* takes place on what the game instruction card refers to as the "Zoo of the Future." It's a multi-tiered chessboard of sorts, with the player's perspective being one of looking down slightly at things. Each tier, or platform, may be accessed by small ladders, and contains a number of "good" squares and one or two "magnetic" squares, called sticky squares.

Your link to the game is Flip, a joystick-directed kangaroo who will leap obediently at a touch of the joystick handle. Like *Q*Bert*, the idea is to cover the good ground while avoiding any random dangers that may be out and about. Unlike *Q*Bert*, there are certain squares which should be avoided. Hop on each of the good squares and you'll advance to the next — and more difficult — level. Land on one of the sticky squares and you'll be held in check for several seconds.

The most subtle danger in *Flip Flop* is one of simple slipage: failure to maneuver Flip just so may result in a nasty fall from the relative safety of the playing board into open space. More obvious threats are the Zookeeper and his flying net. This latter menace appears from level three on, and looks something like a screen door run amuck. Despite its simple appearance, the flying net is a merciless little cuss, and it can put a hurtin' on those high-score hopes toot sweet.

You begin each game with an allotment of five critters (called "tries" in the game's instruction card), and earn an extra one with each level completed. Considering the dangers that are prevalent, it may not be too long before you'll be wishing for another 'roo or two. But gee, Dad, why do they call it *Flip Flop*? Well, son, it's like this...

Sometime during the game design process, someone (Steve Martin is a safe bet, although it was probably the program's author) thought it would be a laff riot to turn the entire playing board upside down at certain points in the game, so the player is looking up at, rather than down on, the playing board.

Bandits

Funny thing is, the topsy-turvey schtick *is* a laff riot, but it also adds immeasurably to the game itself.

Of course, no self-respecting kangaroo would be caught dead loitering Down Under such a contraption. Exit kangaroo, enter one honest-to-Bonzo swinging ape, named Mitch. The basic play idea is still in effect — to touch all of the good squares and avoid falling or tangling with one of the deadly screen doors. But this time, you're doing it upside-down, for cripe's sake. The effect is quite marvelous, though somewhat unsettling the first two or three hundred times you experience it. Lest Mitch wear out his welcome, he alternates turns with Flip.

Any game that boasts 36 playing levels needs something to break up the monotony. *Flip Flop* scores admirably on this account by treating the player to some cute between-levels animation. These cartoon intermissions appear after five levels are successfully completed. In the true Lassie-you've-come-home! fashion, Flip and Mitch are shown having accomplished the true goal of *Flip Flop*: a reunion with their friends back at the circus. It's enough to bring tears to your eyes.

There's quite a bit more to *Flip Flop*, including a running clock you have to race against; double maze patterns, the squares of which require a second visit to score; and the strategy side of the game, which includes buying time by "tricking" the Zookeeper or his flying net onto a sticky square.

The standard space shoot-em-ups and generally poor rip-offs are in such overwhelming abundance that I was tempted to give *Flip Flop* a B on this quiz without so much as having seen a single pixel. But after spending several evenings with the game, I'm happy to report that *Flip Flop* has earned a solid A — solely upon its own merits. The game is visually sharp, the sounds and musical accompaniment complement rather than detract from the visuals (are all of you programmers-cum-Mozarts listening out there?), and the upside-down angle offsets any potential playing tedium. *Flip Flop* looks and plays well. And that's good enough for me.

Bandits
Sirius Software
Sacramento, CA
800/1200 Disk
$34.95

by Duane Tutaj

An arcade-type space shoot-em-up game for the Atari, *Bandits* is 100% machine language and the graphics displays are very well done. *Bandits* requires one joystick and is a single player game.

The object of the game is the time-tested arcade theme: shoot down various space ships or bombs while avoiding being hit by return fire. If an enemy ship survives your fire and reaches the right side of the screen, they will take a portion of your supplies and try to escape to their mother ship, which is located in the upper left-hand portion of the screen. Shooting the enemy while they are carrying your supplies will score more points and return your supplies. You have five packages of supplies in each of the 28 different levels. If the enemy manages to steal all five packages at a given level, the game is over. Bonus points, based on the amount of supplies that you have left, are awarded for clear-

Adventure™ INTERNATIONAL

A DIVISION OF SCOTT ADAMS, INC.

ing the screen of enemy ships.

You start the game with five ships of your own and receive an additional ship for every 5,000 points scored. Your greatest defense is an energy shield that is activated by pushing up on the joystick. Repeated pushes will give you the longest shield life. Whenever you lose a ship, your shields can be recharged to their maximum levels. The game can be paused by pushing any key and reactivated with a second key press — an important feature for anyone surviving several levels of play and needing a bit of non-penalized respite. The good news is that the high score is updated after every game. The bad news: the score cannot be saved on your disk.

One of the more positive aspects of *Bandits* is the graphics. They're quite impressive, especially the fast movement of the various enemy ships. The use of different types of supply items adds color to the game and helps one in determining the current level. The sound effects provide a similar function; allowing the player to distinguish between the different types of enemy ships.

To use the familiar "10" scale, I would rate *Bandits* as follows: Concept-7, Graphics-8, Sound-5, Playability-7, Overall-7. All in all, a modest and reasonably enjoyable effort by Sirius.

Sirius will replace a defective disk for only $5.00 with the return on the original. Hopefully, more software houses will start having reasonable replacement policies.

The screen displays a planet surface with a crater on each side. The right-hand side is a portion of a moon that shows your supplies. In the upper left-hand portion of the screen is the bottom of the enemy mother ship through which the enemy attacks and returns with the loot. At the top of the screen is the scoring display which shows your current score, the high score, and the number of remaining ships. While the game is in progress, stars scroll across the screen at varying rates of speed to add to the illusion of movement.

Dark Crystal

Your ship is located on the planet's surface and moves side to side in true *Space Invaders* fashion, while shooting up at the attackers. At the bottom of the screen is a gauge that monitors the energy left in your shields. Wise players will turn their shields on and off during play to save power for the longest possible protection. Fortunately, competence has its own reward: your depleted energy will recharge slowly while you avoid the enemy attacks.

What makes *Bandits* different from most shoot-em-up-style games are the various combinations of enemy ships that attack. One type of ship is shaped like a rubber ball; it will cascade down on you and continue bouncing up and down off the bottom screen until destroyed. Another unusual ship looks a bit like a centipede and drops napalm bombs. Also, there is the ever-threatening Menace that fades in and out and attacks swiftly.

One important fact about each level is the combination of various enemy ships and the amounts of each ship is different for each level. This means it's possible to be facing elements from several of the most common types of arcade games at one time. This short delay is the one negative part of the whole game. After very fast playing action, it is frustrating to wait up to 20 seconds to see what the next level brings. (Perhaps on the higher levels this wait can be restful and needed to refresh your reflexes, but at the first few levels it really slows down the action.) I feel that a multiple-player option would have been an exciting addition to this game.

B.C.'s Quest for Tires Review

by Reid Nicholson, age 11

B.C.'s Quest for Tires you could say is for the Donkey Kong type of player in the family for in this game you hop on your prehistoric one-wheeler and dodge prehistoric obstacles to save the beautiful girl from the hungry dinosaur.

On the way some of the obstacles you have to dodge are tiny holes and boulders, a fat broad, trees, volcanos and other prehistoric things.

The joystick usage is perfect and the graphics for this game are just as good as the cartoon B.C.

All around you could say that B.C.'s Quest for Tires is the prehistoric home Donkey Kong type of game we've all been waiting for.

The Dark Crystal
by Sierra On-Line
Coarsegold, CA
Atari 400/800/1200
48K Disk
$37.95

by Mark S. Murley

December 1982 saw the release of one of the most anticipated and esoteric films in recent memory: master puppeteer Jim Henson's epic, "The Dark Crystal." Five years and a reported $26 million in the making, this fantasy adventure tapped the talents of literally hundreds of technical personnel to bring an elaborately constructed universe of characters to life.

Unfortunately, after a brief flare of interest, the audiences stayed away in droves. And the critics, while praising the puppet artistry and attention to minutiae, shook an unforgiving finger at Henson for the film's lack of thematic focus and the inability of the puppets to adequately convey emotion. As reviewer Allen Malmquist wrote in Cinefantastique magazine, "For the love of puppetry, 'The Dark Crystal' succeeds, and for the love of puppetry, 'The Dark Crystal' fails."

But in spite of its flaws,

The game that puts space games in perspective. Zaxxon™, one of the most popular arcade games of 1982, is now available for use with your home computer system.

Zaxxon™ technology and creativity present a 3-dimensional-like playfield which sets Zaxxon™ apart from other computer games.

Zaxxon™ looks and sounds like aircraft flight, and players can soar to new levels of home computer entertainment. From the daring attack on the enemy's floating fortress and the blazing battle against the enemy's fighter fleet to the final showdown with the deadly armored robot, Zaxxon™ challenges the skill and imagination of every player at every level of skill.

Imagine yourself the pilot, attacking the enemy fortress–climbing, diving, strafing to score points and extra fuel. The enemy fights back with a barrage of missiles and gunfire. Then you face a fleet of enemy fighters in a gripping dogfight of altitude strategy and flying skill. Survive this battle and the enemy's fortress, defended with laser barriers, then you've earned the ultimate challenge; a blazing confrontation with the powerful robot, armed with a lethal homing missile.

Zaxxon™ is the one game that you must see to believe. You have to play it to feel its impact. If you're ready to face the challenge, check with your local software dealer or send check or money order with $2.00 postage/handling. California residents add 6½% sales tax. Available on cassette or diskette. Suggested retail price $39.95.

Available on Atari® 16K cassette, and 16/32K disk, Radio Shack® Color 32K cassette and disk, Apple® 48K disk.

Datasoft Inc.®
COMPUTER SOFTWARE

"The Dark Crystal" did create a visually exciting and compelling world; a world populated with dozens of strange and wonderful creatures, and more importantly, a world with a Mythos. Watching the film may not have given one the total sense of involvement that Henson and his associates were shooting for, but neither did one leave the theater with feelings of déjà vu: "The Dark Crystal" was truly a groundbreaking motion picture.

The Next Big Film, as everyone knows, is always dogged by enough tie-ins to fill every Toys'R'Us in New Jersey. "The Dark Crystal" was no exception. Last Christmas saw a full complement of "Dark Crystal" books, posters, toys, stationary, and, if one probably looked long enough, underwear. It is my understanding that Henson himself had some control over what was marketed, which would account for the solid quality of some of the items I've run across. Into this category fall several books that chronicle the film's making from preproduction to the final print. Another is the officially sanctioned Adventure game for the Atari home computer, from the folks at Sierra On-Line.

The *Dark Crystal*, as presented by Sierra, is the latest in their continuing line of Adventure games, and their first motion picture tie-in. *The Dark Crystal*, the game, aspires to the same lofty heights as does the film, and comes not on one, but three double-sided disks. The package itself is a handsome, 8½ by 11 inch, 12-page glossy booklet that features the plot synopsis, map-making and hint sections, and a few empty pages for your notes — all printed on thick, parchment stock. Also included is a full color, 17-by-22 inch poster which depicts Jen at the triumphant climax of the movie.

For those of you who haven't seen the film, here's the Reader's Digest condensed version.

Somewhere on the far side of the universe, a spectacle which occurs only once every millenium is about to take place: The Great Conjunction of the planet's three suns. So powerful is this cosmic happening that the urSeks, a gentle race of philosopher beings, have journeyed from their home planet to this world in preparation for the event.

The urSeks proceed to construct a place of worship around the Crystal, which is a large, mystical energy conduit of sorts that can amplify the power of the Great Conjunction to an unlimited degree. The ultimate goal of the urSeks is to use the energy of the Crystal and the Great Conjunction to purge the urSeks' evil sides into nonexistence, leaving only that which is perfect.

At the moment of the Great Conjunction, the urSeks entered the blinding beam of light produced by the Crystal. Each urSek entered as a single being, but exited as two separate races of entities: the hideously replusive Skeksis and the gentle Mystics. Immediately a brawl between the two factions erupted, and the Crystal was damaged, sending a crucial shard flying out somewhere into the surrrounding countryside, lost.

The schism complete, the Mystics abandoned the castle to the Skeksis, and fled to the Valley of the Stones. It was in this place that the Mystics regrouped and began working their largely impotent magic against the Skeksis' growing tide of evil.

Eventually, the Skeksis saw fit to exterminate a third race of beings, the Gelflings. But two infant Gelflings, Jen and Kira, survived the slaughter and were raised by the Mystics and the Pod People respectively. And it is Jen and Kira who have the task of restoring the missing shard to the now-darkened Crystal — an act which will end the reign of the Skeksis forever and restore Harmony to all things.

To paraphrase Malmquist's opinion of *The Dark Crystal's* cinematic counterpart, for the love of ambition, *The Dark Crystal* succeeds, and for the love of ambition, *The Dark Crystal* fails. *The Dark Crystal* scores big points in whittling Henson's "The Dark Crystal" down to small-screen, home-computer size, but an Adventure of this size is either going to be very linear (to expedite the storyline and prevent pointless "sightseeing" excursions by the player) or it is going to mire down like a bloated dinosaur in a primordial swamp of endless details, ending up as entertainment only for Mensa Society members.

The Dark Crystal opts for the linear route, leaving one with the impression that each response typed is either right or wrong, with no middle ground. For the novice, this isn't necessarily a bad thing, but anyone who likes their Adventuring on the, uh, adventurous side may find some difficulty with *The Dark Crystal*.

The second major complaint with the game involves the three-disk format. No matter how you slice it, swapping disks in and out of a drive can be a real pain, and *The Dark Crystal* is not equipped to utilize more than a single drive.

If the narrowness of the game and the disk-swapping problem were the only negative aspects of *The Dark Crystal*, then I might be

tempted to at least recommend it, however, to novice Adventurers. The graphics themselves are a little lackluster, and the color is not the best. This is distracting in an Adventure of this scope wherein so much of the player's time is spent looking at dozens of screens.

Sierra On-Line, by in large, has an excellent reputation for quality Adventures. Everyone misses the mark now and then, and fans of Sierra On-Line will undoubtedly come out soon with a sparkling new game to add to their otherwise solid line of hits.

The replacement of the shard by Jen is the common aim of both the film and the Adventure game. However, the film only requires approximately 90 minutes of passive participation to see realization of the goal; the Adventure version may require a month or more of active puzzle solving.

The three-disk format of Sierra's *The Dark Crystal* Adventure automatically makes it something of an epic in itself. Side A of the first disk contains the standard loader and title screens, leaving the other five sides of disk space exclusively for data storage and retrieval. Happily, Sierra has eschewed any sort of copy protection for all but Side A. This allows the user to make extra copies of the data disks, which can help take the sting out of the occasional disk accident. And a crashed disk can become a nightmare of epic proportions if you've put a lot of sleepless nights into solving the Adventure.

The opening screen of the Adventure finds Jen resting in a forest; we are informed that he is in the Valley of the Stones, which has become the new dwelling place of the benign Mystics. Upon entry of the player's first command, a Mystic approaches Jen with news most grim: urSu, the leader of the Mystics, is dying and that Jen is requested to quickly go to his side. The Mystic disappears, and the Adventure is begun.

It would be cheating to reveal any details about *The Dark Crystal* beyond this point. Suffice it to say, the Adventure revolves solely around Jen's attempt to locate and restore the shard to its proper place in the Crystal. Along the way, a wide range of strange creatures, places and events will be encountered by Jen and the intrepid Adventurer.

The Dark Crystal religiously follows the typical Adventure format of command entry. You control Jen by inputting commands of one or two words, usually in the verb-noun format. If, for example, one is standing in a forest, one might type GO NORTH to move in a forward direction, or CLIMB TREE if one happens to be standing aside an oak. The true challenge of Adventuring comes from guessing which words work and which don't. Considering the limited vocabulary of most Adventures (usually less than 150 words), this is clearly the most time-consuming aspect of play.

Rally Speedway
by John Anderson
Adventure International
Longwood, FL
Atari 400, 600XL, 800XL, 800, 1200
16K Cartridge
$49.95

by Léo G. Laporte

In the beginning there was the driving game. *Night Driver*. And *Night Driver* begat *Pole Position*. And *Pole Position* begat *Turbo*. And *Turbo* begat *Rally Speedway*. And the smell of gasoline and burning tires filled the sky. And

the sound of screeching brakes rent the air. And the players looked down upon the game and saw that it was good.

Sometimes it seems like the driving game has been with us since the beginning of time. Indeed, it is the oldest type of game still popular at home and in the arcades. There are a number of really good ones available for your home computer, including *Rally Speedway*. Before I discuss the merits of *Rally Speedway*, though, I'd like to make some observations about driving games in general.

Most of us drive out of necessity, whether we like it or not. Usually the mundanities of everyday life don't make particularly good video games. In the case of driving games, though, the computer gives us a chance to drive the way we would like. Who hasn't wanted to sit behind the wheel, throw caution to the wind and floor the accelerator. For those Walter Mittys among us, the driving game makes a thrilling escape.

Because of this, a sense of speed is important to the driving game. The driver must feel he can control his machine, but he also must be tempted to push his control to the limit, risking life and limb while doing so. The elements of speed and imminent danger always must be present.

For the purist, that sense of speed and risk is enough, but the competition between rival game manufacturers is so intense that each is trying to offer something more in his games.

Rally Speedway, written by John Anderson, follows this trend. It is both a driving game and a track building toy, and even though it's only average as the former, it excels at the latter.

My only criticism of *Rally Speedway* is in the way Anderson has designed the driving simulation. Most of the driving games I have played and enjoyed give the player a perspective close to the actual driver's. Usually the player sees the road from behind and slightly above his car. This enhances the illusion of speed and makes the game more difficult because of the player's limited field of view. Unfortunately, *Rally Speedway* is designed so the player looks directly down on the car and road surface, just as you look down on *Pac-Man* as he traverses the maze.

This perspective diminishes the excitement of playing the game. First-person perspective has contributed to the longevity of the driving games as a class. By changing that perspective, Anderson has eliminated the most compelling reason to play the game.

Having made that criticism, let me say everything else about *Rally Speedway* is perfect. This is a beautifully designed game. And, to some extent, the challenge of head to head competition compensates for the lack of excitement.

The race is run on a huge track, about 64 screens big. Two different tracks are included with the cartridge. One or two players race around the course. In the one-player version you'll be racing for time; in the two-player version you'll be racing for blood.

As you race, the track scrolls smoothly beneath you. If your opponent gets so far ahead of you that he leaves the screen, you'll be assessed a time penalty and both drivers will be repositioned next to each other.

If you go off the road and hit a tree or a building, your car will explode into flames. The little driver will leap out, roll over and over to extinguish his burning clothes and then jump up and wave to signal that he is all right. Then it's back on the road.

There are a number of options that can be selected from a menu before the game. You may choose dry, wet or icy roads. The trees and houses can be real or the type you can drive right through. Your top speed and rate of acceleration can be set, too.

A few extra options make *Rally Speedway* different from most racing games. These are the LOAD TRAX, MAKE TRAX, and SAVE TRAX commands. *Rally Speedway* allows you to design your own race track and then save it to disk or cassette. This is the part I found most enjoyable, but then I still like to play with Lincoln Logs.

There are 21 different types of tracks to lay, ranging from straightaways to hairpin turns. There also is an orchard, a lake, three kinds of tree formations and three kinds of houses. You may combine any of these.

The grid is 25 elements square. That's 625 elements to plot, but don't worry, it's not difficult. Everything is done with two joysticks and the function keys. Up to 16 track layouts can be saved on a single disk.

Rally Speedway is graphically gorgeous. The controls are logical and easy to use. The race is challenging, even if it's a bit less than exciting.

THE HOTTEST NEW GAMES IN THE GALAXY!!!

SWORD POINT

NEW

SWORD POINT, by William A. Austin, is a very unique and exciting adventure. You will assume the role of a young man seeking to climb to the pinnacle of success in the mythical monarchy of Simafranconia, a nation not unlike feudal 17th Century Europe. It is a country of totally masculine values, where style supersedes substance, and social level is not the best thing, it is the only thing worth acquiring. Dueling, gambling, wenching and high living are among a few of the things that you will do to gain the King's attention. So tankards up . . . a toast to bravery . . . with a little luck and by dancing to the dar-edevil's tune on the Swords Point . . . you may just win! Requires 48K RAM and one disk drive.

$31.95

KARMIC CAVERNS

NEW

KARMIC CAVERNS, by Len Dorfman, is a 100% machine language arcade-style game that will entertain you hour after hour! You must find your way through the maze-like caverns avoiding the deadly plasmatic guards (not to mention the electrified walls) and acquire as many energy pods as you can. You must climb ever upwards striving to acquire enough energy points to reach the next level before time runs out for you. KARMIC CAVERNS utilizes the full sound and graphics capabilities of the Atari computer! Fun for all ages. Requires 48K RAM and one disk drive.

$34.95

PMI

BRINGING COMPUTERS DOWN TO EARTH.

WAMPYR'S TOMB

WARNING!! This adventure may be addictive. WAMPYR'S TOMB, by James Glines, will take you on a journey from the village of Amberpool through a 'mid-evil' countryside filled with magical spells, demons and dragons. Can you stay alive? To prevail in WAMPYR'S TOMB you must do more! You must equip yourself to do battle with the LICH and win. (Of course there is the option of dying!) We will supply you with a little money and the opportunity to go where you've never been; the courage and the desire to conquer the unknown must come from within. WAMPYR'S TOMB will not only challenge your bravery, your intelligence and your cunning, but will take you beyond your imagination into a realm of new and exciting forces where only legends survive. Requires 48K RAM and one disk drive.

$29.95

PROGRAMMERS!

If you have written a program that is technically sophisticated and also "user-friendly," PMI would be interested in publishing your work. For information on how to submit your material write to: PMI, P.O. Box 2895, Winter Park, FL 32790-2895, Or phone (305) 644-3822.

Family Place

by Dorothy Heller

Violence is in the news these days. Recently, millions of Americans tuned in to a television special that portrayed "The Day After," a nuclear attack — the ultimate violence. The plot of another popular film, "War Games," portrays the prospect of nuclear Armageddon as a giant computer game.

Most people don't want real violence in their life, and would be horrified if the zapping, smashing, blasting shoot-'em-up on their computer screen turned from fantasy to reality. Nevertheless, violence seems to be a pervasive theme in lots of computer and arcade games.

"When I take my nephews out for pizza and arcade games, I'm really bothered by the violent content," states one young businesswoman. "I like computer games, but I don't get a charge out of winning by smashing a space ship or blowing up a planet. That kind of reward doesn't feel good to me."

The questions for this month are: how much killing and carnage take place on your home computer screen? How does it affect the way your family uses the computer? And finally, what's the alternative?

Violence, Competition, and Aggression

When Tom Malone began doing research for a doctoral thesis on the qualities that make a successful computer game, he wasn't looking for the results that he found. To his surprise, he discovered that there are differences in what girls and boys like about computer games.

For example, he studied student reactions to an educational game called "Darts." Malone concluded that boys liked the fantasy of making arrows pop balloons. Girls disliked it. He discovered there were other statistical differences in the way girls and boys responded to themes of violence, competition and aggression in computer games.

Of course, human beings aren't statistics. You may be the mother of four and the family Star Commander. But look around you the next time you're in a situation where kids are playing arcade and computer games: How many of the active participants are girls? In your own home, do the female members of your family get as much use and enjoyment from computer games as the males?

"Our concern," says Elizabeth Stage of the Lawrence Hall of Science, "is that many more boys than girls are getting intuitive knowledge and experience through computer games. Women who haven't experienced this crucial first stage of playing with electronic media will lack confidence and hands-on knowledge when it comes to learning programming and other skilled activities."

Remember the scene in "War Games" when the arcade game-playing computer whiz hero told his girlfriend to keep her hands off the keyboard ?

Social Pressure and Social Maturity

"It's reasonable for many girls and women to dislike explosions, bombing, shooting, and killing in computer games," Stage says. "It would be wonderful if more people in general didn't like violence!"

In addition to a dislike for violence, social pressure starts to turn off many girls from computer games — and ultimately, from computer confidence and computer careers.

According to a recent study by Far West Laboratories about computer education in the school, girls show equal interest in computers at the elementary level, but begin dropping out in junior high. "Girls still face discouragement from parents and teachers." Even more powerful is peer pressure.

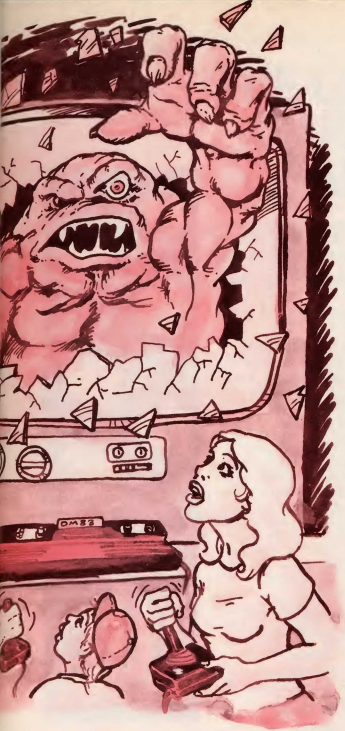
Girls also tend to mature socially earlier than boys; and girls are encouraged to pay more attention to social relationships. As a result, teen-age boys are "object-oriented." girls are "people-oriented."

Friendly Games for Girls (And Boys)

Does this mean that computer games should be packaged in pink and blue, or that software for women should be limited to cookie recipes?

Definitely not! Fortunately, there are creative and friendly alternatives that make it possible for *everybody* to enjoy computer games.

San Francisco State University's Mathematics Net-



work Curriculum Project, for example, has developed computer activities that appeal equally to girls and boys. Says educator Bill Finzer: "In designing our materials, we minimized aggression and competition" encouraged cooperation, created network situations so kids could communicate with other classrooms via modem, and encouraged the use of computer graphics for artistic purposes."

Finzer found that junior high school-age girls loved networking and communicating with electronic pen pals with the modem. (The secret password for one female computer club was "Boys"!) He also discovered boys also enjoyed the creative and non-violent activities just as much as the girls.

Researchers at Atari's Home Computer Division commented that games stressing cooperation, "creature" games that feature likeable characters rather than space enemies, and word games that have components of humor, surprise, and whimsy are more attractive to female players.

Pacman, of course, is one of the most successful arcade games of all time, and the most violent activity in it is muching! It is also the first arcade game to attract a substantial female following, hence *Ms. Pacman*.

I've also noticed that our blood-thirsty 13-year-old and his computer friends spend hours playing *Miner*, *Frogger*, *Pacman*, *Salmon Run*, *Centipede*, and other computer games that use charm instead of violence. They even sing along to the music in *Miner* (if they think no one is listing!)

The Friendly Alternative

There are many positive steps that parents and educators can take to make sure computers are for everyone, not just for fledging space warriors.

1. Support learning and game software that uses imagination instead of violence. Use the computer for family fun and learning, not just zapping enemy aliens. Enjoy the exciting, mind-bending capabilities of Atari LOGO™, learning games such as Crossword Magic™ and SCRAM™, and encourage your kids to create their own excitement by learning how to program.

See "Equal Games for Girls" and "Evaluating Game and Educational Software" in COMPUTER CONFIDENCE: A Woman's Guide, by Dorothy Heller and June Bower, Acropolis Books Ltd., to learn more about game and learning software and resources.

2. Organize an "Expanding Your Horizons in Science and Math" conference for junior high school-age girls in your school district or community. The Women's Math/Science Network, which has been helping women to organize conferences since 1974, provides a comprehensive handbook and coaching.

One of its recent conferences included panel discussions and Career Exploration Sessions with women who are carpenters, electricians, nuclear physicists, physicians, computer systems analysts, rangers, podiatrists, cabinetmakers, data-processing managers, and elevator mechanics! Write to:

Women's Math/Science Network, Math/Science Resource Center, Mills College, Oakland, CA 415-430-2230.

3. Get involved with computer education in your local school district, as an educator, PTA member, aide, or volunteer.

Find out:

- What computer activities are being offered.
- What percentage of girls participate.
- What programming

languages are being taught.

- If math is a prerequisite for taking a computer course.

4. Since many schools require algebra as a prerequisite to learning BASIC, encourage computer education with Atari LOGO and PILOT. LOGO and PILOT are "friendlier" languages that are great for beginners and children as young as elementary school age. Better yet, both languages really encourage young learners to think, solve problems, and use their own creativity.

5. Learn to program your own games! A wonderful new resource that teaches game programming with fun and humor is Dr. C. Wacko's Miracle Guide to Designing and Programming Your Own Atari Arcade Games, (Addison-Wesley). Dr. Wacko and his wife Petunia demonstrate that games can have heroines as well as heroes, and can be about getting to school on time or who put the clam dip in the computer instead of death and destruction.

6. Encourage "networking" via modems and the telephone as a home and school computer activity. Using the computer to contact electronic pen pals and exchange information is a "people-oriented" activity that girls enjoy as well as boys. A valuable resource is Free Software for Your Atari Computer, Enrich/Ohaus Publishers, $8.95.

7. Practical applications aren't just for business. Word processing is a fantastic tool that can help you and your children develop creativity and learn self-expression. Encourage your entire family to learn about all computer applications.

Give peace a chance! And give everyone in your family the chance to express their personal creativity with the versatile Atari computer.

More to Come

In future columns, we'll interview an expert on arcade games and women; a women's software group

that writes games based on their own experiences as homemakers and working women; and discuss creative programs that enable you to use your computer as an artist's palette.

Dorothy Heller lives in the heart of Silicon Valley, California and writes about people and computers. She is co-author of COMPUTER CONFIDENCE: A Woman's Guide (Acropolis Books) and Free Software for your Atari, (Enrich/Oahus).

THE GREATEST ATARI® GAME OF ALL TIME.

Object: Capture more programs than from any other source. Score: The best prices for programs win.

Actually, every member of CompuClub is a winner, because no one pays lower prices for Atari® programs than our members.

And no other source offers as many programs, with a descriptive catalog covering every piece of software we offer!

CompuClub has hundreds of Atari® programs: games, education and business. It's an astonishing selection, but just as incredible are our prices and our catalog.

Prices always at least 25% below retail

Fact is, usually our prices on selected programs are even lower than that. And we're always running sales with savings of at least 50% from the list price on some of your favorite programs.

And there are several ways to pay: MasterCard, Visa, or the ever popular check or money order.

Annotated catalog, updated every 45 days

We don't like to knock the competition, even by implication, but there are definite advantages to a CompuClub membership. One of the best of them is our catalog, which not only offers an unbelievable number of programs, but includes a description of each and every one of them.

In fact, the catalog is so big and filled with so much information that we print a separate price list. And we keep adding so many programs that we have to update the catalog nine times a year during the course of your membership.

Think of it! No more wondering what's behind the fancy label, no more shooting in the dark or depending on the word of a clerk who may not be familiar with the program you're interested in.

Exclusivity for Atari® owners

We're not trying to be all things to all people. We are definitely the best thing since the floppy disk for Atari® owners, and only Atari® owners. CompuClub is very exclusive.

Our catalog is thick with hundreds of Atari® programs, and only Atari® programs. No more fumbling your way through thickets of strange symbols and codes for the different computers everybody else's catalogs try to cover.

The rules

The rules are simple. To play the CompuClub "game," you've got to be a member. Anyone can join, as long as they fork over a mere five bucks, and agree to buy three programs during the year of membership. Order and buy your programs at any time during the year, but we're sure with our selection and prices that you'll want to get going right away.

Five dollars buys you a one-year membership, exclusive Atari® program offerings, a fully annotated catalog with 9 updates during the year, a current price list (and any necessary updates), a subscription to our newsletter, and discounted prices at all times, including announcements of our periodic sales, which feature savings of 50% off and more.

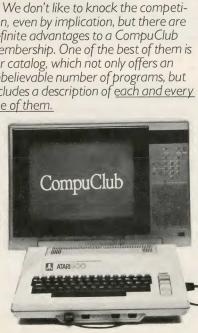
You can join by filling out the coupon below, or get an instant membership by calling our toll-free number and giving us your MasterCard or Visa identifying number. We'll forward your registration and sales order materials, your catalog and price list, so you can begin ordering right away.

That's all there is to it.

If you think you play a good game, you've got to join CompuClub. It's easy to play, and it saves you money.

We think it's the best Atari® game going, because with us, everybody wins.

CompuClub
Where Atari owners belong.



YES, I want to play the greatest Atari® game of all. Please enroll me in CompuClub for one year, and rush my registration material, catalog and price list to me. I agree to buy any three programs during the course of my year of membership. I have enclosed my payment of $5, or authorization to bill my charge card account.

CompuClub, PO Box 652, Natick MA 01760 Dept. H-R

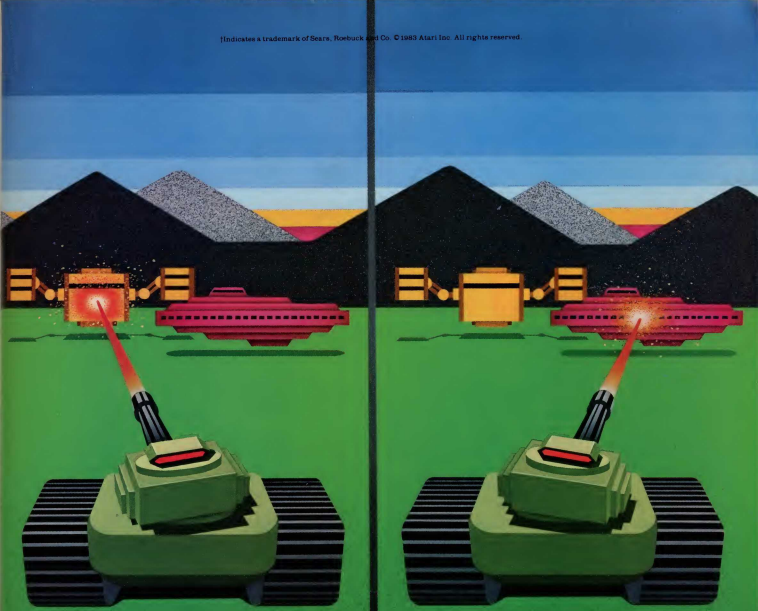
Please have your MasterCard or Visa card ready when you call. In Massachusetts, call 1-617-879-5332. We will forward your membership materials after confirming authorization for your charge.

"Every time you send me out as a back-up computer on one of your used tugs, I wind up being traded for an Atari math cassette!"



Which player is making a tactical error?

You've fought BATTLEZONE™ tanks, flying saucers and fighters in the arcade. Now it's time to protect the home front. Because Atari's BATTLEZONE is now prepared to wage war right in your own living room.

The player on the right will most likely fail in his mission. He should've hit the fighter first. Even though it is worth 3,000 points less than the flying saucer, it is far more dangerous. It can destroy. The saucer can't.

There's another way you can rack up extra points, and you don't even have to fire a shot. By moving your tank to one side, you can often lure one enemy into another's line of fire.

Surviving BATTLEZONE is no easy mission. If you're up for it, climb into your troop transport and make tracks to the nearest store that stocks Atari games.

Only Atari makes BATTLEZONE for the ATARI® 2600™ Game, Sears Video Arcade† systems, and a version exclusively for the ATARI 5200™ SuperSystem.

ATARI

Club Med & Atari

The oft-heralded "computer revolution" has been on the near horizon for as long as most of us can remember. And many people believe that's exactly where it should stay — far, far away so as not to threaten everyday existence and job performance.

Decades of science fiction literature and movies have touted computers as mysterious, powerful machines that only the truly gifted can understand and successfully operate.

In the past few years, as the computer has evolved into the desk-top wonder, many people are panicking. This scary unknown is suddenly a part of their lives. They fear the computer will vividly underscore undesired shortcomings. What if they can't perform on the computer in an age when most occupations are at least indirectly linked to some form of computerization? This fear strikes people where it hurts worst — it's a perceived threat to job security.

Club Mediterranee, the world's largest vacation village organization that has sold package vacations to its members to escape the stresses of civilization for more than 30 years, has identified the computer phobia many people have developed. Club Med reasoned many people could overcome their fears and relax with computers if instruction and practice opportunities were offered in a non-threatening environment without the intrusion of everyday urban life.

In 1983, Club Med and Atari Inc. together introduced a pilot computer program at Club Med-Punta Cana in the Dominican Republic. Atari supplied a number of its home computers, in addition to customized software and trained instructors to ease vacationers into their first computer experience.

True to the Club Med philosophy, however, the computer opportunities are just that — opportunities. Instructions are included in the all-in-one vacation package

by Linda K. Gilliam

price. Club Med vacationers can experiment with the computer or not. There is no pressure to perform, just the opportunity to relax and learn something new.

"Many people are afraid of computers and are afraid of change," said Gerard Barouh, chef de village at Punta Cana. "Our goal is to ease people into learning about computers. We realize it is very difficult to learn something new after working all day long, especially when you have to sacrifice family and leisure time. But on vacation, you have the time. You're relaxed and no one is judging you. It's easier to learn and become enthused about what you have learned when you're relaxed."

Club Med, the first resort organization to offer a sports school, is also a pioneer in providing computer instruction to its members.

Linda Gordon, Atari's vice president of special projects, sees the Club Med computer experience as a milestone in human relations for both companies. "Atari and Club Med are both interested in people and the future. This was a real opportunity to marry both of these common interests. We have learned that in places where people *need* computers the least are probably the best places for them to discover the technology."

It is the enhanced communications aspect which sold Barouh, a native Parisian, on the project. "If people don't learn about computers today, it may be impossible for them to speak to their children tomorrow. We don't want to see these big ruptures in society. If I have a large computer screen on stage and sing a song in French, our American vacationers can follow the words in English," Barouh said.

That's communication. I wouldn't do it all the time because it's friendlier to speak my bad English. With our tennis or sailing computer games, which operate in French, Spanish and English, people of different nationalities can speak and play together. It makes it more interesting."

Club Med-Punta Cana, with its full slate of water sports like swimming, windsurfing, sailing, snorkeling and water skiing, offers an equal number of computer attractions to tempt vacationers. In addition to computer mainstays like BASIC language programming, accounting, word processing and games, Atari has provided customized painting, music, astronomy, astrology and weaving software. As Atari became more attuned with Club Med philosophy, it also developed a tennis tournament organizer, which operates in English, Spanish and French, and a computerized video dictionary to help divers identify the marine life they observe.

In order to get vacationers chummy with computers, Club Med also has relaxed standard classroom barriers. Specially designed computer kiosks are stationed around the village (including the beach) for immediate access to activity information. And if that isn't laid back enough, computer instructions are available on a beachside deck. A total of 83 computers are in use throughout the village.

"The computer program here is only a very important part of our total program," said Barouh. "We want people to realize everything is possible at Club Med. If they want to learn to sail, they can learn to sail. If they want to sleep, they can sleep. Everything is possible. It's like a buffet. You choose what you want. Knowing you can do what you want is very important for a healthy state of mind. The opportunity to choose is Club Med. The computer can help us do all this and enhance communication."

Club Mediterranee, since its inception in 1950 as a sports association in France, has taken the best elements

of the traditional European vacation and added a few distinctive touches of its own to build a vacation empire known worldwide.

Today, the company operates 92 villages in 26 countries, 13 of which are located in the Western Hemisphere.

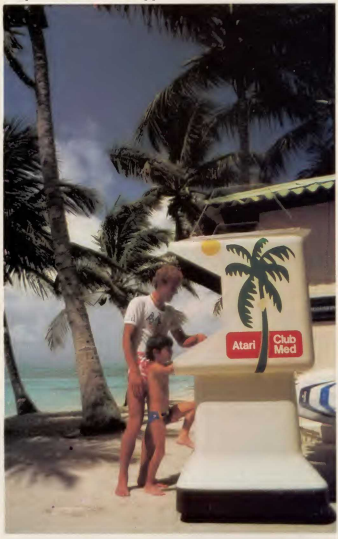
Club Med has designed its vacations to preclude the constant dole of money (no tipping), fancy wardrobes (club attire is a swimsuit and a pareo, a Tahitian sarong),

and television, telephones, radio and newspapers. Club Med also features a one-price package for room, board, sports activities and entertainment, an international clientele and a very relaxed atmosphere.

In addition, Club Med takes a special interest in children and is one of the few resorts which actually encourages couples to include children in vacation plans. At five Western Hemisphere clubs, including Punta Cana, Club Med has established Mini-Clubs, for children four to seven,

and Kid's Clubs, for the eight to 12 age group. Children participating in either basically get the same vacation experiences as their parents, under careful supervision, while parents are free to indulge their own pursuits.

At Punta Cana, computer instructors are assigned to the Mini-Club and Kid's Club so children get the same computer introduction opportunities. Children aged four



to seven stay free with their parents (they only pay air fare), while those eight to 12 are half-price vacationers.

"Club Med has great traditions and a beautiful history," said Barouh. "Atari was able to adapt computer software to Club Med philosophy and flexibility. Technology without philosophy is not enough. But now we offer both. We are ready for tomorrow."

Club Med members can visit Punta Cana via a non-stop charter flight from Houston to Santo Domingo, Dominican Republic. Total package cost, including airfare, is under $800 per person, per week.

Linda Gilliam is a freelance writer living in Austin, TX.

Music Theory Drills

Part 2

by Duane Tutaj

In this issue I will continue with Part 2 of my Music Theory Drills. This installment will test the student on note and rest symbol identification.

In music theory, there are certain symbols that represent rhythm values. Note symbols have four parts: note head, stem, flags, and dots. Rests are different. Some are boxes while others are represented by curved and diagonal lines. Rests can also have dots.

You will be given a chance to see each symbol and its corresponding name by pressing option 5 on the menu screen.

The Note Symbol Drill starts by displaying two title screens and playing a new version of the arcade song from the last installment. This is followed by the instructions. Next comes the menu screen.

There are four options of drills and two additional options available from the menu.

Option 1 consists of a question drill on the 10 simple note and rest symbols. This quiz tells you the correct answer if your choice was incorrect. Option 2 consists of the same 10 notes and rests but only prints CORRECT or INCORRECT after your response. Option 3 adds five more rhythmic symbols and shows the correct answers. Option 4 is similar to Option 2 but includes the five additional symbols.

Option 5 displays the list of musical symbols and their corresponding terms. (See Fig. 1.) Beginners can study these symbols and their names before running the rest of the drills. Option 6 is the exit from the program.

Once a level is chosen, the DRILL screen appears and asks you to select the correct answer. A note or rest symbol drawn by a custom character set appears, followed by the three choices. By using a joystick, you can move the blue bracket behind the A, B, or C. When the blue bracket is placed correctly, push the trigger button to enter your selection. The results will appear on the bottom of the screen. When you are ready for the next question, move the joystick in any direction. This will cause the question and answers to be wiped from the screen and the next question to appear.

After the 10 or 15 questions have been answered, your results will be printed on the screen and you will be given

Fig. 1

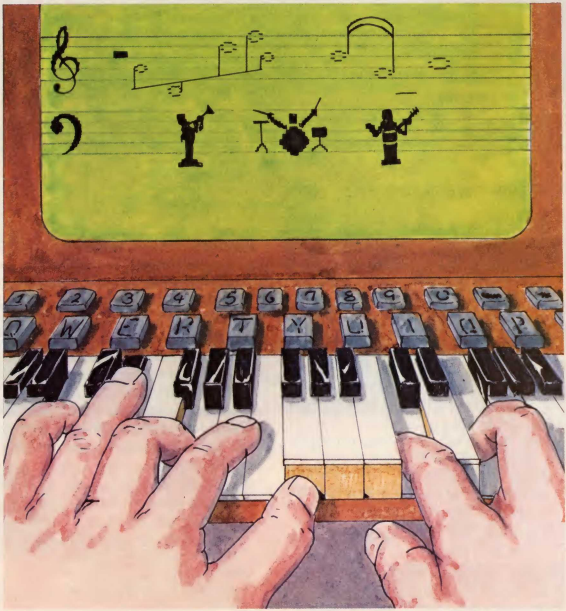
an option to run the same drill again, return to the menu, or quit.

A nice feature of this program is that whenever there is a correct match to a question, that question is removed from the list of possible questions. However, if a wrong answer is given, that question may reappear, with the answer choices being scrambled. This will force the user to read the correction and remember the correct answer.

By mastering the last Music Theory Drill installment (Note Name program) and this Note Identication program, you will be able to look at traditional music notation and translate the printed symbols to the correct names of the notes and their rhythmic equivalent. This will enable you to transfer the music into number values taken from any of the reference charts of the Atari Sound Commands.

For instance, the note located on the bottom line of the treble staff is E and has a number equivalent of 96 in the Sound command (Sound 0,96,10,10). By using the following values for the various rhythms you will be able to play each sound for its appropriate length.

Whole note	— 320
Dotted half note	— 240
Half note	— 160
Dotted quarter note	— 120
Quarter note	— 80
Dotted eighth note	— 60
Eighth note	— 40
Sixteenth note	— 20



Hear at last. Games with

Alien annihilation never sounded so good.

Because we've broken the sound barrier on home computer games. With music. You heard right. Music.

And we're not talking mamby-pamby little bleeps here, pal.

We're talking toe-tapping, finger-snapping, Top-40 stuff. Scored just for our newest releases. And playing throughout.

Which ought to keep a Joystick Jockey like yourself humming right along through each and every blast, bomb and blow-up that threatens your existence.

From strategy games to shoot 'em ups.

Are you ready to face the music?

If Our Music Has You Hearing Things, Wait Till You See This.

Incredible, arcade-quality graphics.

And they're so great—how great are they? They're so great you'll want to play them again and again. And then you'll tell your friends about them. And they'll want to play. And then your family will find out and they'll all want to play. And then that fat kid down the block will want to play. And all your sister's friends. And their boyfriends. And... better keep our newest releases a secret. Or get Dad to pop for another Atari.

The First Games Ever, That Tell You What The Heck Is Going On, Right At The Start.

It's just like a movie.

Except, instead of filling both hands with buttery popcorn, you've got your hand on the Joystick, tensed up for what's to come.

And while you wait, poised, ready, eager, you'll find out, through the terrific screen titles, the objective of the game, the characters and the scenario.

You'll find out what planet you're on.

What the fuss is all about.

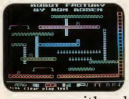
Why you're involved.

And perhaps of singular importance to you, how to keep from being obliterated.

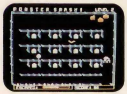
real music for your Atari.*

Our star. Our Numero Uno. The Tail of Beta Lyrae.™ Changes as you play. Will drive you out of your mind with unexpected switcheroonies. No one's ever mastered it. But you sure can try...

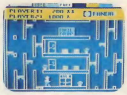
And then there's Cosmic Tunnels.™ Four games in one. Meaning four times the challenge. Four times the chance you might just get blown away. The graphics are sure to blow your mind!



Mr. Robot and His Robot Factory.™ Looking for a factory job? Here's an opening. Help Mr. Robot thwart the aliens. Screens scream with color, action and sound! Plus, a graphics kit to design your own game screens!



Monster Smash™ is the gravest game to ever hit the cemetery. And it's filled with a deathly strategy. What do you have to do? Mash the monsters! Let the visitors live.



Cohen's Tower™ gets you used to life in the Big City fast. Starting you off in a skyscraper. But the boss is really watching. So work fast. You might just get a raise... if you can handle the action.

Get ready to bring your Atari the most playable, the most graphically involving new games it's ever screened. Or heard.

It's the most out of our minds.

And together, with your Atari, we make beautiful music.

DATAMOST™

The most out of our minds.

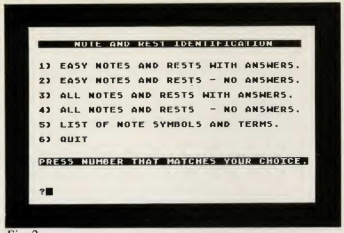


Fig. 2

If you need a rest, use the sound statement of Sound 0,0,0,0 for the appropriate length. Here is an example of the first four notes of the song *JOY TO THE WORLD*.

```
10 SOUND 0,60,10,10
20 FOR J = 1 TO 80:NEXT J
30 SOUND 0,64,10,10
40 FOR J = 1 TO 60:NEXT J
50 SOUND 0,72,10,10
60 FOR J = 1 TO 20:NEXT J
70 SOUND 0,81,10,10
80 FOR J = 1 TO 120:NEXT J
90 SOUND 0,0,0,0
```

This type of programming works but is very inefficient. See my use of arrays in the arcade music section of the Note Identification program for a tighter use of code.

In the next installment I will have a slot machine game that makes the user determine the combined rhythmic total of the various notes and rests.

Program Description

The program starts by initializing five string variables and two arrays. The string variables will contain the answer choices and also will print the music symbols to the screen with a custom character set. The two arrays are for keeping track of which questions have been answered correctly and the arcade music sound routine. The keyboard is opened up for the GET command and the screen is made blank to increase the speed of moving and drawing the custom character set.

Lines 100 to 160 jump to the subroutines that write the character set, draw the title screen, play the arcade music, print instructions and display the menu screen. (See Fig. 2.) The question array is also filled with zeros and the counters and scoring variables are set before the drill begins.

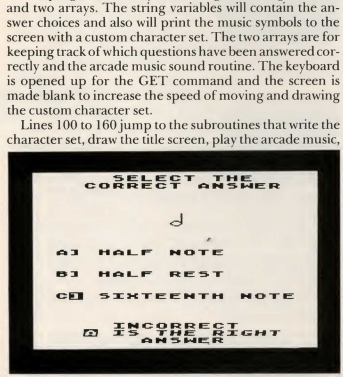

Fig. 3

Lines 200 to 210 print the Drill program heading and then goes to the main loop at line 1000.

Lines 299 to 350 contain the various sound routines used in the program.

Lines 1000 to 1320 contain the main loop of the program. The first step is to go and get a note or rest symbol. The program then places two more possible answers in the variables B and C. The RND function then generates a number from 1 to HM (which is either 10 or 15). A check is made to see if the chosen music symbol is also that number, if not, then a third choice is generated. This all takes place in lines 1050 to 1080.

Next, the music symbol and answer choices are printed to the screen. Lines 1200 to 1216 contain the joystick routine that moves the blue bracket corresponding to your choice of answers. By adding 128 to CHR$(93) we get a blue bracket. To print the gold bracket just use CHR$(93).

If the joystick is moved up, S is given a value; a sound is played and then a jump is made to the correct line that positions and prints the new blue bracket. Next, a gold bracket is printed in the former location. A similar set of commands is followed when the joystick is moved down.

After the bracket is moved (or if you do not move the joystick) a check of the trigger is made to see if you have entered your selection. If not, there is a return to line 1203 to read the joystick again.

If you selected an answer, a check is made to see if it matches the correct answer (A). If you are correct then the right variable R is incremented. A 1 is placed in the question array to prevent using that question again and then the correct sound is played. The message CORRECT is printed to the screen and then a jump is made to 1300 to check for an end of quiz, followed by a check to see if the joystick is moved. If the joystick is moved then the music symbol and answers are all erased from the screen with an appropriate sound. The program then returns to line 1000 and starts the main loop again.

If a question is answered wrong, the variable W is incremented, the incorrect sound is played and the INCORRECT message is shown depending on whether the correct answer should be displayed or not. (See Fig. 3.) This is all done in lines 1230 to 1260. A jump to 1300 is made to check for end of quiz. If not, the screen is erased and the loop is started over again.

Lines 1500 to 1655 are the scoring routine with the results printed on the screen. You may run this quiz again, go to the menu screen or quit.

Lines 2000 to 2115 contain the routine that selects the music symbol, checks to see if it had been used before, gets the position for the correct answer and prints the music symbol to the screen.

Lines 3000 to 3330 get the answer strings and print them on the screen based on where the correct answer will be.

Lines 15000 to 15100 contain a series of short routines that will move the existing ROM character set to RAM and then change a couple of characters.

Lines 20000 to 20070 contain the title screens and call the arcade music routine at line 25000.

Lines 20100 to 20175 contain the menu screen routine. The arcade music routine is located in lines 25000 to

COMPUTER SOFTWARE SERVICES

End all ATARI CARTRIDGE development and BACKUP headaches . . . get

ATARI ONLY $69.95

THE "PILL"! ®

ATARI ONLY $69.95

The "PILL" allows you to store the contents of your Atari executable CARTRIDGES on disk or cassette (up to twenty 8K programs or ten 16K programs each with file names on a single disk!) simply and instantly!

The "PILL" allows you to select and EXECUTE any of the stored CARTRIDGE programs with equal ease and simplicity!

The "PILL" not only allows you to BACKUP your CARTRIDGE programs, but is invaluable for the development of new programs or modifying existing programs!

The "PILL" works with ALL ATARI 400's and 800's having 48K. No installation required.

- Transfers your cartridges to disk or cassette.
- Stores up to 20 programs on a single disk; (requires only 7 seconds for 8K programs or 14 seconds for 16K programs!)
- Allows you to EXECUTE and run programs which were transferred to disk or cassette.
- All files can be transferred using standard DOS.
- Free software is included with the purchase of THE "PILL" containing several useful utility routines.

THIS PRODUCT SHOULD BE PURCHASED FOR MEDICINAL PURPOSES ONLY . . . NOT PIRATING!
DISTRIBUTOR/DEALER inquires welcome.

Send $69.95 plus $4 shipping and handling (N.Y.S. residents please add 7% for sales tax) to:
COMPUTER SOFTWARE SERVICES
P.O. Box 17660
Rochester, New York 14617

Mastercard-Visa-Money Orders or Bank Checks.
Phone orders:
(716) 467-9326.
Atari is a TM of Atari Inc. The "PILL" is a TM of Computer Software Services (division of S.C.S.D. Inc.)

PROTECT your DISK programs and files BEFORE lending them out!

ATARI ONLY $49.95

THE "PROTECTOR"! ™

ATARI ONLY $49.95

Includes hardware and software! The "PROTECTOR" produces a true BAD SECTOR GENERATOR which will allow you to create BAD SECTORS wherever you wish (approximately 10 per second!). You'll never have to fool with ridiculous speed adjustment or tape jerking schemes again! Simple do it yourself installation requires 15 to 20 minutes!

The DISK software is the most versatile that we've ever seen and it's lightning FAST! Allows you to move and rearrange data anywhere on the disk, scrambles directories making them unaccessible to others, and offers INSTANT mapping of file disks (requires one second for ENTIRE disk!). Simple operation.

All these features are done from a 720 sector FULL VIEW map for total operator viewing and simplicity!

- Multiple drives
- Digital SECTOR indicator
- Directory scrambler
- Moves/arranges data
- Selectable read/write
- Selectable start/end
- Hex conversion
- Disk Duping
- Disk mapping
- Instant map
- Compaction
- Fast formating
- Auto-formatting
- Bad sector memory
- Instant restart
- Multiple copy function

DEALER/DISTRIBUTOR INQUIRIES WELCOME!
Our other fine products include
THE "PILL" and **THE "SILENCER".**

Send $49.95 plus $4 shipping and handling (N.Y.S. residents add 7% sales tax) to:
COMPUTER SOFTWARE SERVICES
P.O. Box 17660
Rochester, New York 14617
Phone Order:
(716) 467-9326

Mastercard-Visa-Money Orders or Bank Checks. Atari is a TM of Atari Inc. The "PROTECTOR" is a TM of COMPUTER SOFTWARE SERVICES (division of S.C.S.D., Inc.) 100% WARRANTY (replacement only - no refund policy.)

THE "SILENCER"! ™

Dramatically quiets your disk drive and allows you to WRITE to BOTH SIDES of any disk! Eliminates annoying clunk-clunk-clunk while formatting and the LOUD grinding noise when reading BAD SECTORS! Also allows writing to both sides of any disk WITHOUT dangerous cutting or notching. Five minute installation. No soldering. Greatly reduces drive wear. Send $49.95 plus $4 shipping and handling to **COMPUTER SOFTWARE SERVICES**, P.O. Box 17660, Rochester, New York 14617, Phone **(716) 467-9326.**

THE XL "FIX"! ™

The 1200XL is a superior computer with one exception . . . approximately 35% of available software is incompatable . . . until now! The XL "FIX" allows your 1200 or new XL series computers to run 99% of all software previously incompatable (maybe 100%, but we're allowing for a possible exception!). Other great features are: the XL "FIX" is software only (no hardware changes), it resides in RAM (actually INCREASES your usable RAM memory), and because it's in RAM . . . all you programmers can actually modify the OS any way you wish! Send $49.95 plus $4 shipping and handling to **COMPUTER SOFTWARE SERVICES**, P.O. Box 17660, Rochester, New York 14617, Phone **(716) 467-9326**

THE "REMOTE"! ™

How many times have you wound up cursing because you always have to reach around the computer to the rear side and tumble your way through a maze of wires and switches to find your ON-OFF switch just so you can reboot a disk or cassette??? Eliminate this aggrevation forever! Purchase THE "REMOTE"! THE "REMOTE" is a tiny little device that can be mounted anywhere on your computer or on your desk near the computer. When you wish to boot a disk or cassette . . . simply tap THE "REMOTE"! Ten second installation; no tools required. Send $19.95 plus $4 shipping and handling to **COMPUTER SOFTWARE SERVICES**, P.O. Box 17660, Rochester, New York 14617, Phone **(716) 467-9326.**

★★★

26155. A short explanation on how this works will enable you to use this same routine in your programs.

Restore the correct Data line to make sure that the correct data is read into the sound array. Then read four values by using a short for-next loop. If the Data statement contains the value of 9999 then the routine will end. Now that the four values have been placed into the YY array we are able to play four voices at one time by using these values in the four Sound statements.

The use of Setcolor in line 25315 just changes the colors in the title screen. After the tune is played, turn off all the Sound statements and then return to the rest of the program.

You will notice that I do not use any for-next loops for delays in this routine. That is because each note is based on the shortest value needed in a song. In this tune, the shortest value is an eighth note and therefore, each of the four values represent one eighth note value of sound. When a longer value is wanted just repeat the same pitch number in the next four Data values. Look at line 26000 and you will see that while the 1st and 5th pitch number changes the 4th and 8th number stays the same. This results in the melody playing two different eighth notes while the bass line holds a quarter note. Careful examination of this routine will give you better insight into how you can play four-part songs in any of your programs.

Lines 28000 to 28120 print the various music symbols and their corresponding term names to the screen as requested from the menu screen.

Lines 29000 to 29110 contain the routine that prints the instructions on the screen.

I hope that this program will generate many ideas on how to use the various routines in your own programs. If you come up with any interesting combinations, let me know.

THE ATARI DRAWING BOARD

by Vern L. Mastel

Inspired by the Apple Graphics Tablet, the following *Drawing Board* program uses a number of the Atari's special features, including player-missile graphics. Player-Missile graphics let you mix text from the Graphics Mode 0 with the high resolution Graphics Mode 8 screen, without using fancy tricks like display list interrupts. The program runs on any Atari computer with no modifications.

The program is very simple. You control all drawing from two joysticks (which need not be actual joysticks), and you're guided by two cursors placed on the screen. The cursors are single resolution players which take priority over all screen images.

These cursors mark the ends of lines to be plotted when in the line mode. They mark the opposite corners of rectangles when in the box mode. They mark the center and radius of a circle when in the circle mode. When in the draw or print mode, one cursor is disabled (actually positioned off the edge of the screen), and the other is used to guide all of the screen work.

The program is broken into three sections: cursor positioning, command processing and initialization routines. Lines 100 to 184 handle all of the positioning chores. The status of the joysticks plugged into ports 1 and 2 is read and translated into cursor positions on the screen and the triggers on the sticks are read at the same time.

All the while, the program continuously monitors the keyboard, checking for changes in the operating mode, translating and reading what is going on between each and every point plotted on the screen. Remember this, if you feel the cursor motion is too slow.

The initialization routine is used only once and sets up the parameters for the program. It also sets up the machine language routines that allow you to move vertically. These routines are tucked away into page six in memory.

Lines 10 through 90 are the main subroutines for screen processing. Line 10 clears the screen and restores the cursor. Lines 20, 30 and 40 plot color changes. Line 45 is very important. Because the screen coordinates for player-missle, graphics do not correspond to the coordinates for plotting on the playfield. I had to translate the actual position of the player-missle cursors into normal playfield coordinates. Line 45 calculates these.

Lines 50 through 85 check the range. This routine ensures that your plotting remains inside the normal playfield boundaries.

You should pay special attention to the section of the program in Lines 1200 to 1320. This is a very, very fast load and save routine or saving your drawings to a disk. (It will work with a cassette as well, but more slowly.) This routine comes straight from the pages of De Re Atari (B-37) and has been elaborated on in Softside Magazine, (Issue #33, page 82).

The routine uses the CIO to move the screen image very rapidly. It copies all of screen memory and sends it to the disk. Loading the image, it reverses the process, and loads the bytes coming from the disk directly into screen memory. The whole process of saving or loading takes less than 30 seconds. The only drawback is that the routine gobbles up large quantities of disk space, about 60 sectors per screen. See Table 1 for a review of *Drawing Board's* commands.

The Vertical Move

Two different routines move the cursors. To move horizontally simply increment or decrement the value in the PM position registers located at decimal 5324B and 53249.

Moving vertically is a bit more complicated. I used a machine language subroutine that rapidly moves the player's bit patterns through the memory. This routine is not my own creation. I found it on page 318 of Your Atari Computer, A Guide to the 400/800 by Poole, Martin and Cook. I did adapt it to handle the motion of two players, by making use of several additional unused memory locations. It is simple and very effective.

The command process changes operating modes and colors to plot or draw. Remember, even though you draw in Graphics 8, you still have only two colors to work with, 0 and 1. This means that if you want to erase a line, you simply plot it again in color 0!

To plot in color 1, press joystick trigger 1. To plot in color 0 (erase, if

L:Line mode, the cursors mark the endpoints of the line to be plotted.

D:Draw mode, one cursor is removed for the screen.

C:Circle mode, one cursor plots the center of the circle and the other sets the radius. For this to work correctly the cursors must be in line horizontally on the screen.

B:Box mode, the cursors mark the opposite corners of the rectangle to be plotted.

P:Print mode allows text to be added to the drawing at the specified position. To escape without printing enter an asterisk.

I:Inverts the screen, black to white.

N:Returns the screen to its normal mode.

F:Fill mode works like The Box mode except that the area bounded by the rectangle is filled with a solid color.

Control L:Load from specified file. To load from a disk file specify D:filename. To load from a cassette file just enter C:.

Control S:Save to specified file. The same format as outlined above applies to saving. D:file name for disk and C:for cassette.

Control C:Clear the screen without saving the picture.

you prefer), press joystick trigger 0.

Note, if you select inverse screen display, the colors will be reversed. Holding down a trigger button, while moving a cursor, will produce some very interesting effects. By all means experiment!

Lastly, what about joysticks?

For my current drawing box, I have a unit which has 10 push buttons on it. Four are for each joystick, and the other two for the triggers. I find this arrangement infinitely preferable to joysticks simply because it can be run with one hand.

Atari Drawing Board

THE WITNESS: WHODUNIT?

11:37 p.m. Thirty-fourth Street and Steeler Avenue. The heat hangs low and close over the alleyways of the hopeless. A tortured cat mewls in the distance. The street lamps throw stark pools of light onto the curb and gutter.

by Mark S. Murley

The trail ends here at a flophouse on Steeler. Biscuit City it ain't, but let me tell you something, Bud: After two months of scratching for clues in every armpit and hovel in the city, Mecca couldn't look any better to a Moslem. I draw a smoke from a pack, fire it and survey the scene.

Leaning against a metal lamppost, I feel its cool sting knifing through my jacket. Tepid sweat runs down my temples. The view from here is good, but as I stare up towards a darkened, two-story window, I figure that works both ways. I move off toward the shadows.

The smell of the flophouse assaults me from the doorway like a kick from a wino's foot. The door handle, worn smooth from years of use, opens onto Squalor with a capital "S." That's the way Stiles might've said it.

Inside, the stairwell conforms to the rest of this oversized, "handyman's special" (as those well-oiled realtors put it). The steps sway and groan loudly with each footfall.

On the second floor a half-dozen doors open onto a pea-green hallway. Muffled voices seep through the thin walls. Somewhere a radio is playing. Leaning against the wall, I can hear the paint curl.

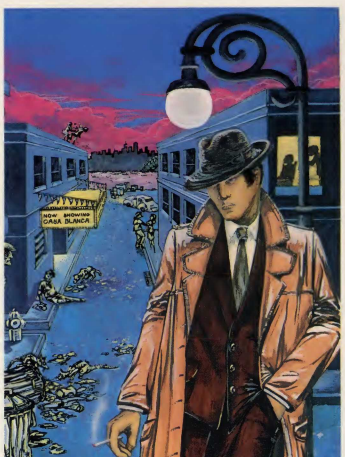
The third door on the left: Room 207. No voices, no music come from within. No light leaks from under the doorjamb. The lock submits quickly to the pick, and with a single quick motion, I step inside, revolver leveled and sweeping for action.

Mark S. Murley writes documentation and ad copy for Adventure International. Among his credits are the sagas of Wadsworth Overcash in Russ Wetmore's PREPPIE *series!*

The room is sparely furnished: a small icebox, an unmade bed beside a nightstand, some clothes draped over a chair, an ashtray overflowing with a month's worth of butts. Not much of a housekeeper. On the kitchen table rests the payoff: an Atari 800, its CRT peering into the half-light. I lower the gun, holster it, and pull up a chair to the table.

A manilla police file is propped against the Atari. Opening it I shake the contents onto the table. Everything's here, everything but the sweat that is. The next 12 hours will tell the tale...

Straight from the pages of the 10-cent pulps of the '30s and '40s comes Infocom's *The Witness*, an interactive whodunit adventure that echoes the format and flavor of the Cambridge-based company's phenomenally successful *Deadline*. And like its predecessor, the motif is once again murder most foul.



Here's the lowdown. It's February, 1938. Virginia Clayton Linder, a "gilt-edged society dame" has turned up face down. As the chief police detective for a small California town, it's up to the player to ferret out enough evidence for an arrest. And there's no shortage of suspects in a rogue's gallery of colorful, supporting characters that would cause even Hercule Poirot to cringe.

The challenge is intensified by a rigid time limitation: You have 12 game-time hours and not a minute more to crack the case. And, as you might suspect, you'll need every precious second.

You enter commands in simple English, for example, "Arrest The Suspect," "Fire The Gun," and so on. Unlike many adventure games, The Witness accepts complex sentences entered on a single input line, provided that the conjunction "then" is used or a period is added. Thus, to save time, a player may enter "Arrest The Suspect Then Fire The Gun."

But why save time, you might ask? Ah, there's the rub. Each time you enter a response, the game time advances. Some investigative actions take about a minute, while others, such as the command Wait, can cause 15 minutes of game time to roll by.

Once sufficient evidence is accumulated for a bust, the venerable Sergeant Duffy will assist you in putting the accused into the slammer. But bear in mind that "sufficient" evidence requires that you establish three major elements: motive, method, and a reasonable opportunity for the accused to have committed the crime.

Following the arrest, you will receive, via your Atari, a letter from your superiors regarding the outcome of the grand-jury investigation. If the D.A. follows through with an indictment, you win the game. If not, your superiors will probably fill you in on where you went wrong, and you try again.

Here's the letter received after the lover of Virginia Linder, Stiles, was accused of the murder and placed under arrest.

Text of a letter from Police Chief Klutz dated February 28:

Dear Detective:

According to your report and deposition, the only question in this case is who shot Mr. Linder through the window of his office. However, I believe that the real story is not so simple.

But, despite my reservations, the trial jury did convict Mr. Stiles of the murder. Through plea-bargaining, his sentence was reduced from execution to twenty years.

Post script: A few months later, after you are transferred to another department, you get a memo from your former boss. It says that new evidence was discovered in the Linder case, causing the court to reverse Stiles' conviction and set him free. Let's hope he doesn't come around bent on revenge!

Clearly, receipt of such a letter at game's end is undesireable, and indicates either slipshod or incomplete investigative work on the part of the player. Waiting for the letter of confirmation is half the fun though, and an exciting climax to what usually amounts to be a very lengthy game.

Through its meticulous attention to detail and thick slabs of prose that advance the plot, *The Witness* immerses you in its cavernous storyline. The following is an example of these elements from early in the story.

"You are now in the living room. A fieldstone fire-

place on the south wall holds a blazing fire, filling the living room with warmth and light. Grouped in front of the fire are a glass-topped coffee table and a rattan davenport and club chair, with cushions covered in a print showing bamboo plants in the style of a Japanese brush-painting. A lamp with printed shade and a telephone sit on the table. On the north wall are a console radio and a liquor cabinet made of light-colored wood. A single door in the east wall is closed, and at the west end of the room is a double door."

Considering that most, if not all, of the objects in the preceding paragraph can be individually examined, and that this is but one of many "rooms" in the game, you can readily see that your 12-hour time limit will not be idly whiled away!

The "human" factor is quite important throughout the course of play. Each of the many characters in *The Witness* has his or her own unique characteristics, and the prudent armchair dick is well advised to take full advantage of this fact. Calling someone by his or her name is important, too. If you wish to ask Mrs. Jones the last time she saw Mr. Stiles, "Mrs. Jones, when did you last see Mr. Stiles?" is much preferred over an interrogative that does not include her name.

Similarly, one would probably not wish to apply a "Mrs. Jones" to the Linder's Oriental housekeeper, Mr. Phong, who "carries his stout body lightly" and whose imposing musculature is apparently evident despite his loose-fitting apparel.

"To put it bluntly, Simpson, this takes care of my finances and doesn't look down its nose at me if I want a week in the Bahamas!"

Much of *The Witness* accepts the typical adventure-game nomenclature. If you wish to move west, for instance, you can type "Walk West" or simply "W." A list of 52 important commands is supplied with the program, although the game's vocabulary is much larger.

As with most products, software or otherwise, the consumer's first impression usually derives from the product's packaging. Infocom is well-known for its truly innovative packaging as anyone who has examined *Deadline*, *Star Cross*, or *Suspended* will attest. *The Witness* falls a tad short of the complexity of the elaborate *Deadline* mishmash of physical evidence and printed matter, but it is nonetheless lavish and detailed.

The Witness package resembles an actual police file when it's removed from its slipcase. Inside the file is a plethora of documents and a couple of pieces of physical evidence. The material includes:

The Detective Gazette — a slick, 8-page replica of a detective magazine, replete with authentic period ads for fingerprint kits, police badges and handcuffs. This cleverly designed booklet is actually the program documentation.

The Register — a full-sized, two-page reproduction of Santa Ana's "official" newspaper.

A page of Virginia Clayton Linder's stationery — the handwritten suicide note that instructs the late Mrs. Linder's daughter to pass a caustic farewell along to Mrs. Linder's two-timing husband: "Tell your illustrious father how deeply I regret soiling one of his precious revolvers."

A Western Union Telegram — from Freeman Linder to PMS Chief Detective.

A book of matches from The Brass Lantern restaurant.

Several additional features of *The Witness* include game save, a running account of hours and minutes (game time), and a nearly indispensable script feature that allows a transcript of the game to be printed as the game is played.

The Witness is, by virtue of its complexity, superior to the bulk of adventure fare that has glutted the market for the past three or four years. Don't look for graphics, however. *The Witness* is an all-text format. This, along with a special data retrieval process allows the program to access over 100K of information. To put it another way, the amount of text in *The Witness* approaches novella length.

The Witness is the brainchild of Infocom's Stuart Galley. He spent about nine months researching and developing *The Witness*. He says, "The program was designed not so much as a sequel, but as a complement to *Deadline*."

The Witness offers documentation that is inventive, apparently error-free and concise. *The Register* and other accompanying paraphernalia give a solid feel to the package, legitimizing the steepish $49.95 price tag. The game itself, in spite of its complexity is extremely user-friendly, and often quite humorous. Infocom cut no corners in the design or — if you'll pardon the pun — execution of *The Witness*, and it shows. A hearty round of kudos to Stuart Galley and Infocom for an admirable effort. *The Witness* is a killer.

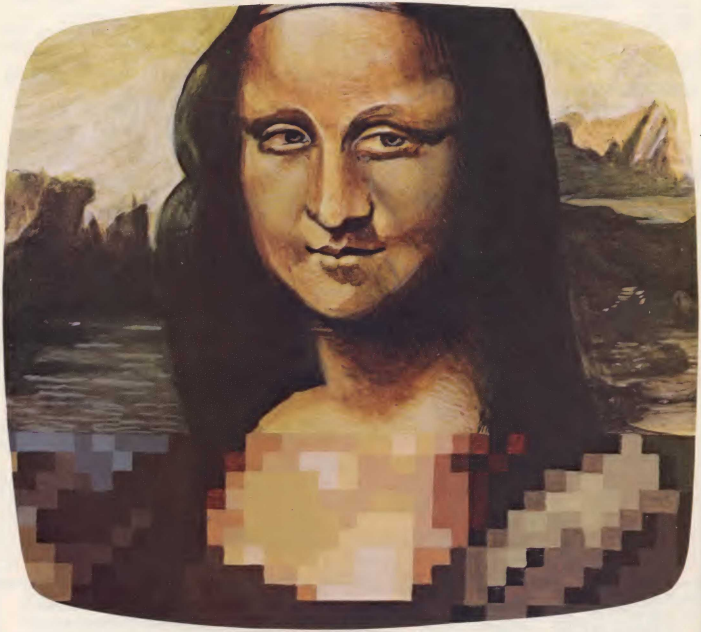
The Artist & the Computer



by Pam Sexton

We've all been told that a painting is best viewed from a distance, but to understand the finer details of an artist's technique requires a closer scrutiny. Some "Old Masters" are even studied using magnifying lenses.

If your interest in television graphics is purely for enjoyment, you can sit back and appreciate its color and design. If, however, you'd like to understand the graphics display, you'll have to move closer to the screen. This series of articles will take you closer to the screen.

First, let me introduce you to some vocabulary that is fundamental to graphics and microprocessors in general.

Pixel. Imagine your monitor is overlaid with a sheet of graph paper designed to fit exactly on the screen. We are interested in the little squares that fit together to create the paper. Each one of these squares is a pixel.

Binary. Anything binary consists of only two parts. In a binary world, we see only black and white. Statements are true or false. Inside a microprocessor are two conditions: on or off. A zero (0) indicates an off condition; one (1) indicates an on condition. The microprocessor is a binary world of 0's and 1's.

Bit. A contraction of "binary digit." A bit is either a zero or a one.

Byte. Humor does exist in computerese. Take a handful of bits—0's and 1's—until you have hold of eight of them. Line them up in any pattern you choose. You then have a byte, a group of eight digits.

Register. An area reserved in a computer to hold a designated value. For example, a color register is used in the Atari 800 to hold a value that represents a certain color.

Character. An image that is defined by turning "on" or turning "off" pixels in a pattern within an eight-block wide by eight-block deep square or "matrix." (Eight digits across equals one byte; each matrix is eight *bytes* deep.) For example, the letter A and the image of a starship are formed as follows:

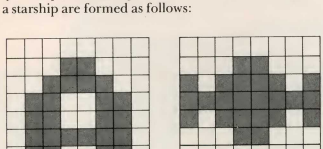


Fig. 1. 8 x 8 Matrix pattern of the letter "A" (left) and Starship image (right).

The Atari Character Set

The operating system within the Atari 800 supplies a standard character set. These are the familiar keyboard images: alphabetical characters and special-purpose characters such as the dollar sign ($) and equal sign (=). The full character set contains 128 characters. But, as a computer graphics artist, you are not "locked" into this character set. You have the option of creating up to 128 of your own unique graphics patterns and replacing the standard character set. To do this you must use that portion of memory reserved by the operating system for its alphabetical characters.

To use the Atari character graphics you must:

- Define the character set
- Convert,the graphics images into computer data
- Display the image onto the television screen.

As expressed previously, a character consists of pixels placed in a pattern on an 8x8 matrix. With this restriction, you may initially feel that your artistic attempts are somewhat confined. Not to worry. Begin with a large sheet of graph paper dimensioned in some multiple of eight, for example, 32 x 32 squares or 512 x 64 squares. Sketch an appealing image on the paper. After you have finished your drawing, divide the paper into 8 x 8 squares.

To demonstrate, I'll be a little less industrious and use a sheet of graph paper dimensioned to 48 x 32. That gives us 24 possible characters (See Fig.2).

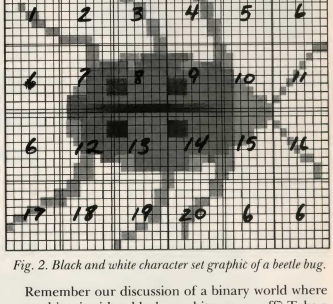

Fig. 2. Black and white character set graphic of a beetle bug.

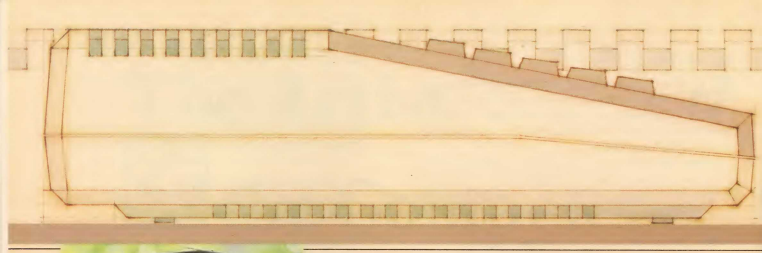
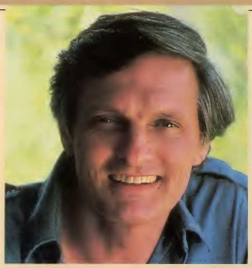
Remember our discussion of a binary world where everything is either black or white, on or off? Take a look at each square of the drawing. Whenever you encounter a square that is to be colored, assign it the value 1. And, likewise, whenever you run across a square to be left blank, assign it the value 0. Encoding the first 8 x 8 block in Fig.2, produces the following result.

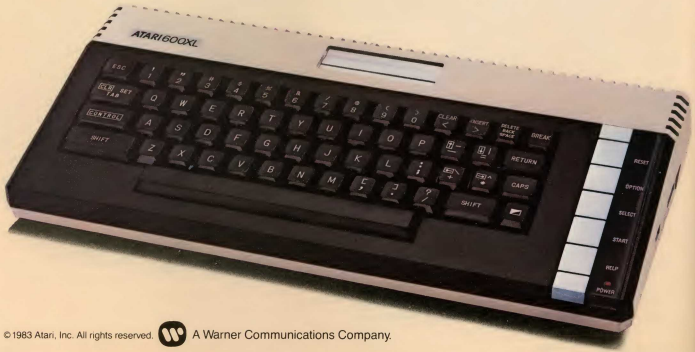
```
0 0 0 0 0 0 0 0
0 0 0 0 0 0 0 0
0 0 0 0 0 0 0 0
0 0 1 0 0 0 0 0
0 0 0 1 1 0 0 0
0 0 0 0 1 1 0 0
0 0 0 0 0 0 1 1
0 0 0 0 0 0 0 0
```





Computer enthusiast Alan Alda uses the ATARI 800XL Computer System. Alda reports: "It's going all the time!"

Introducing the Atari® XL Home Computers: We made them smart enough to know you're only human.



A Warner Communications Company.

The new ATARI XL Home Computers prove that you can blend state-of-the-art technology with good old fashioned friendliness. What's a friendly computer? For one thing, it's a computer that speaks your language. Both the new ATARI 600XL™ and the new ATARI 800XL™ Computers come with a built-in BASIC language that uses the same simple English you use to converse with the rest of the world.

Press the HELP button, not the panic button.

Every ATARI XL Computer comes with a HELP key. Something you won't find on any other home computer. New programs are becoming available that let you use this key for helpful "prompts" when you're unsure of what to do next. Press another special key and your ATARI XL automatically performs a self-diagnostic check—a feature that can save you a needless trip to one of our more than 1,000 ATARI Service™ Centers.

The ATARI 600XL: It Gets Smarter As You Do.

With 16K of memory, the inexpensive ATARI 600XL can handle over a thousand programs: including education, home management, word processing and personal development. Like all ATARI Home Computers, it gives you 256 colors, four sound channels and Atari's unsurpassed graphics. But unlike a lot of other computers, the ATARI 600XL is ready to grow when you're ready to grow. Every ATARI XL Computer is fully compatible with every ATARI peripheral ("peripherals" are added on to expand what your computer can do).

ATARI peripherals include: a low-cost, letter-perfect printer for word processing. A telephone modem that lets you use your telephone to connect your computer to other computers thousands of miles away. A disk drive and a cassette recorder to store data. And Trak—Balls™ and joysticks to use with Atari's unequalled lineup of great arcade hits. An ATARI 600 XL Computer can be turned into a very brainy 64K computer at a very affordable price.

The ATARI 800XL: Power Enough For Over 2,000 Programs:

With 64K of built-in memory (as much as the more expensive Apple and IBM computers), the ATARI 800XL can take on any of over 2,000 software programs. That's five times as many as a Commodore 64.

There's VisiCalc®[1] for electronic spreadsheets—faster than the fastest accountant. The Home Filing Manager™ to help keep track of everything from medical records to phonograph records. Family Finances to keep up with your cash flow. Educational programs like Juggles' Rainbow™[2] that helps preschoolers develop skills necessary for recognizing the alphabet. Even "An Invitation To Programming,™" for learning how to program.

When You've Got Our Computer, You've Got Our Number.

If you ever find yourself stuck, or have any questions at all, just give us a call. 800-538-8543. (In California, 800-672-1404.) Feel free to talk it over. Because if there's anything friendlier than an ATARI Home Computer, it's the humans who make them so friendly.

You'll do more with Atari Home Computers.

[1]VisiCalc is a registered trademark of VisiCorp.
[2]Trademark of The Learning Company.

Adding Color to the Beetle

Let's interrupt our discussion momentarily to introduce another element. This black and white environment is less than pleasing. By adding one more color, say a red-orange, you can transform the ominous-looking beetle in Fig. 2 into a more glamorous ladybug. But, how can you do this if you're restricted to a binary system?

It's time to fine-tune our character definition. A character is an image defined by lighting pixels in a pattern within an 8-bit by 8-byte matrix. When dealing with a two-color image, a single bit can define the color for a pixel. Therefore, the width of a character is eight pixels. However, when you are dealing with more than a two-color image, you must use a two-bit combination to define the color for a specific pixel. And so, the maximum character is now limited to a four-pixel (four-block) width.

Using Atari Basic you can assign colors to any of four color registers. You access the color as you need it by referring to the register that contains the color value. This process is known as "indirection."

Think of these registers as an artist's palette, and imagine the Basic program statement as the artist's brush. Every time the artist dips his brush into the color in the upper left corner of the palette, that color ultimately appears on the canvas. If the artist dips his brush into the color in the lower right corner of the palette, then that color appears on the canvas.

Imagine that an artist's palette can hold only four containers of color at once. He now has to hire an assistant who will run around and exchange containers to

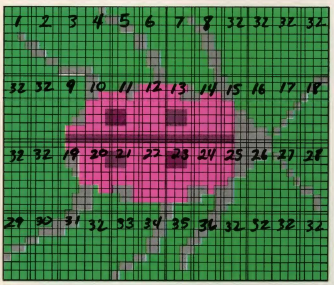


Fig. 3. Three-color character set graphic of a ladybug.

provide the artist with more colors. In the Atari this artist's assistant is our Basic Setcolor statement. The Setcolor statement calls a color from the appropriate registers. The color registers in the Atari are labeled Playfield 0 through Playfield 3 and Background. Basic can access only four of the registers at any one time.

The Atari operating system assigns a specific combination of bits, a bit pattern, to indicate a particular color register.

Returning to our example, let's place black in Playfield 0 and use this register to color in the legs and antenna. And let's place green in Playfield 1 and use this as an outline color for our graphic display. Finally, let's place a red-orange in Playfield 2 to transform our ladybug. Using the bit-pattern in Table 1, our drawing now looks like Fig.3.

Bit Pattern	Register	
00	COLBK	Background color
01	PF0	Playfield 0
10	PF1	Playfield 1
11	PF2	Playfield 2

Table 1. Bit Pattern to Register Assignments

Let's code Character Number 11 in Fig.3.

```
10 10 10 10
10 01 01 01
11 11 01 11
11 11 11 11
01 01 11 11
01 01 11 11
11 11 11 11
01 01 01 01
```

Fig.4. shows the three-color pattern for character number 11.

Fig. 4. Character Number 11 from the colored ladybug.

Binary Conversion

Because Basic requires decimal data, you must now convert the binary pattern into decimal equivalency. The eight binary digits of any byte correspond to an exponential power of 2.

The rightmost bit of any byte sits in the 2 to the 0 power position, and the leftmost bit lies in the 2 to the 7th power position (Fig.5).

Fig. 5. Binary to decimal conversion of an eight-digit byte.

$2^0 = 1$ $2^4 = 16$
$2^1 = 2$ $2^5 = 32$
$2^2 = 4$ $2^6 = 64$
$2^3 = 8$ $2^7 = 128$

To convert the binary pattern of 0's and 1's to decimal means that you add the powers of two in those positions containing a one and disregard any position of zero value. So, the first byte in Character Number 11

looks like Fig.6.

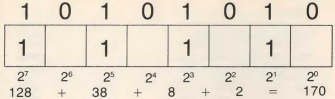

Fig 6. The appropriate power of two is added where the digit one is in position.

And the second byte equals 149 (Fig.7).

Continue to obtain the decimal equivalents for all your characters. To complete the example, the remaining bytes are 247, 255, 95, 95, 255, 85. This is the most time-consuming task related to character design.

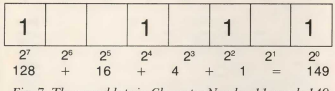

Fig. 7. The second byte in Character Number 11 equals 149 decimal.

Displaying the Image

By entering Program Listing 1 you can display the example ladybug graphic. Several elements enter into this program:

- Choice of colors
- Position of the display
- Sequence of characters
- Display list instructions
- Choice of graphics mode
- Position of the data in computer memory

In the next article, I will go into the detail of Program Listing 1 and provide you with enough information so that you can display your own character graphics. Meanwhile, I invite you to work on your character set, and prepare for programming and animation!

NOTE: Line 1 of Program Listing 1 is created as follows: ?"[ESC][CTRL.DOWN ARROW] [ESC][CRTL.DOWN ARROW] [ESC][CTRL.DOWN ARROW] [ESC][CTRL.DOWN ARROW]" The purpose of this line is to move the cursor below the ladybug so that it will not interfere with the graphic. The CTRL and Down Arrow keys are together in brackets to signify that they should be pushed simultaneously.

The Computer Book Club®

"The *Only* Book Club for Micro Users!"

POWERFUL PROGRAMS INCREDIBLY LOW PRICE!

(Order No. 5046)

A $46.90 Value for Only $2.95!

- **Includes Ready-To-Run Software Disk containing all 55 programs featured in this outstanding programming guide .**
- **Models 400 and 800 with at least 16K.**

7 very good reasons to join The Computer Book Club

P.O. Box 80 Blue Ridge Summit, PA 17214

- **Big Savings.** Save 20% to 70% on books sure to increase your know-how
- **No Risk Guarantee.** All books returnable within 10 days without obligation at Club expense
- **Club News Bulletins.** All about current selections—mains, alternates, extras—plus bonus offers. Comes 13 times a year with hundreds of up-to-the-minute titles you can pick from
- **"Automatic Order."** Do nothing, and the Main selection will be shipped automatically! But . . . if you want an Alternate selection—or no books at all—we'll follow the instruction you give on the reply form with *every* News Bulletin
- **Bonus Books.** Immediately get Dividend Certificates with *every* book purchased and qualify for big discounts of 60% to 80%
- **Bonus Specials.** Take advantage of sales, special events, and added-value promotions.
- **Exceptional Quality.** All books are first-rate publisher's editions selected by our Editorial Board, filled with useful, up-to-the-minute information

ATARI® Programming . . . with 55 Programs plus Companion Software Disks

ONLY $2.95 when you join

Here's your opportunity to begin enjoying more exciting programming action. . . more sound and graphics for both practical *and* entertainment programs.

No prior computing knowledge is needed, everything is right here in easy-to-follow, step-by-step format . . . including actual program examples to get you started. You'll find details on the architecture of your ATARI 400 or 800 . . . learn the principles of program organization including how to use and understand flowcharts . . . how to handle statements, commands, editing keys!

Subroutines to save memory space and programming time, how to work with strings and find and trap errors . . . arithmetic functions, graphic modes (including color and sound control), and special computer functions . . . you'll find it all in this power-packed programmer's guide!

All the tips, tricks, and hints that aren't found in ordinary user's manuals have been included . . . so you'll be able to start writing your own programs using all of your ATARI's many unique and exciting capabilities!

PLUS, you'll get a set of companion software disks that contain *ALL 55 programs* documented and described in *ATARI Programming . . . with 55 Programs*. Designed to save you typing time and help eliminate typing errors, this tested and proven software is your special bonus for joining The Computer Book Club now!

The Computer Book Club®

P.O. Box 80 Blue Ridge Summit, PA 17214

Please accept my membership in The Computer Book Club and send my copy of *ATARI Programming . . . with 55 Programs* with companion disks (No. 5046), billing me at $2.95 plus shipping and handling charges. If not satisfied, I may return the book and disks within ten days without obligation and have my membership canceled. I agree to purchase 3 or more books at reduced Club prices (plus shipping/handling) during the next 12 months, and may resign any time thereafter.

Name _____ Phone _____

Address _____

OH, THOSE ?$*& ERROR MESSAGES

LAST OF A SERIES

BY STEVE HARDING

Welcome, computer pals, to part 3 of our series on the Atari BASIC Error Messages.

If there is terminology used in this month's installment, I refer you to the first two parts of the series. I have also used De Re Atari, the Atari BASIC Reference Manual, the Atari Disk Operating Reference Manual and the Atari 850 Technical Manual as reference. Having copies of these books in your library will be helpful in understanding the material I'm covering.

Error Code 142:
Serial Bus Frame Data Overrun

If this error continually happens,

Atari suggests you have your computer checked. Something is wrong.

Error Code 143:
Serial Bus Frame Checksum Error

Data communications between your computer and a peripheral device have become garbled. The error could be generated by your software or by your computer or a peripheral device. If it is a recurring error, carefully check your program. If the software seems correct, then perhaps there is something wrong (heaven forbid) with your computer or the peripheral device.

Error Code 144:
Device Done Error

I probably have had more problems with this error than any other. In my case, it means the disk I am trying to extract data has decided to take a hike. Or, it can mean the disk drive has taken a hike and cannot extract the data.

If it is the latter, the usual cause is a change in the disk motor RPM. There is one more thing that can generate this error. Fortunately, it is not serious. You have tried to write data to a disk that has a write-protect tab in place. Remove the tab and all should be well.

Error Code 145:
Read After Write Compare Error

This error is generated by the Screen Editor. You've tried an illegal Graphics Mode. Specifically, 12, 13, 14, or 15. And ... you are using a 400 or 800 home computer. No, I'm not psychic. The XL computers have additional graphics capabilities.

Error Code 146:
Function Not Implemented

You are trying to implement a function your computer knows nothing about. Usually, it means attempting to do something like trying to PUT data to the keyboard.

Technically speaking, the device handler does not know how to follow your instructions. Check your program for the correct command and the correct device.

Error Code 147:
Insufficient RAM

Your computer does not have enough memory to implement the Graphics Mode you have called. Try to squeeze your program into less memory. See De Re Atari for some helpful hints, or use a Graphics Mode that doesn't need as much memory.

Currently, there are no Error Codes 148 and 149. Error Codes 150 to 154 are Error Codes you can get when using the Atari 850 Interface Module. At present, no other Atari peripheral device will generate these errors.

Error Code 150:
Port Already Open

You attempted to OPEN one of the RS232 Serial Interface ports when it was already open through a different IOCB. You can access a single serial port through a single IOCB only.

Error Code 151:
Concurrent Mode I/O Not Enabled

You have tried to do Concurrent Mode I/O (XIO 40) without telling your 850 exactly what was planned. Check your program listing. Chances are you used an incorrect value when you opened the IOCB. Read up on Concurrent Mode I/O in the Atari 850 Interface Module Technical Manual.

Error Code 152:
Illegal Buffer

Atari, in its infinite wisdom, allows you to create your own buffer, rather than use the 40-character buffer in the Atari 850 Interface Module. If you don't supply the correct address of the buffer to your computer or the buffer length was not what the computer expected, you'll get this Error. See Section 9 — Starting Concurrent I/O in the Atari 850 Interface Module Technical Manual.

Error Code 153:
Active Concurrent Mode I/O Error

This can be a "fatal" error, causing your computer to "freeze" up. What has happened is you have opened Concurrent Mode I/O to one port of the 850 Interface Module and then attempted I/O to a different port. The 850 doesn't like that. Your computer isn't too happy, either. That's why it goes away. Sometimes pressing the SYSTEM RESET will correct it; most times it won't. Make sure that if you open IOCB #1 for Concurrent I/O you are sending your data to IOCB #1.

Error Code 154:
Concurrent Mode I/O Not Active

This is similar to Error Code 151. You must activate Concurrent Mode I/O using the XIO 40 command BEFORE you start performing input with either the BASIC GET or INPUT commands.

Error Code 160:
Incorrect Drive Number

Each disk drive on your system must have a buffer allocated to it in your computer memory. This is handled by your DOS. If you have more than one drive on your system and you continually get this error, then you have to modify the DOS.

This is not as difficult as it sounds. Boot your system with the BASIC cartridge in place. Type PRINT PEEK (1802). For a two-drive system you should receive a value of two. For a three-drive system you should receive a value of seven. For a four-drive system you should receive a value of 15.

If you don't get the corresponding value, don't worry. Here's how to fix it. Type POKE 1802,X. For X input the proper value. Now type DOS. When DOS Menu comes on screen,

type H and rewrite DOS to your disk. The proper values will be in the proper place the next time you use this disk to boot your system.

Error Code 161:
Too Many Open Files

Each opened file (or peripheral device, such as the 850 Interface Module serial ports) must have a buffer area allocated to it in memory. If you try to open more files than you have allocated memory ... you get a 161.

Assuming you have allocated buffer space, you can have up to eight files open at the same time. But, you have to modify your DOS to do it. Type PRINT PEEK(1801). The value you receive will tell you how many files or devices you can have open at the same time.

Follow the instructions given under Error 160 to modify your DOS to allow more open files. Remember that your printer and the screen editor both use one of these same buffer areas, so if your program has Graphics Mode changes or prints out to the printer, you will not be able to have eight files open. Oh ... by the way, your computer has reserved one of the buffer areas (#0) for output to your television or monitor.

Error Code 162:
Disk Full

This one's easy. You've used all the available space on your disk. Save your data to another formatted disk.

This error will pop up at the most inconvenient times. Even when you KNOW there are some sectors left. This means the File Management System (FMS) on your disk is fouled up. All is not lost. Format a new disk, then write a new copy of DOS to it. Use the C or O command from the DOS Menu to copy all the files to the new disk. Your data is safe and sound.

Error Code 163:
Unrecoverable I/O Error

Sounds frightening, doesn't it? What it means is your DOS has a glitch or your disk is bad. Copy your files to a new disk.

Error Code 164:
File Number Mismatch

Each sector containing data on your disk has an area that tells your computer where to find the next sector containing data for that particular file. If, for some reason, these pointers get an incorrect value, then your system gets confused and quits.

There is no way to save the file without using a Disk Utility package. Copy the remaining files to a new disk and take your lumps.

Error Code 165:
File Name Error

You can't use a filename that contains anything other than capital letters. DOS doesn't like it.

Error Code 166:
POINT Error

I see you finally started experimenting with NOTE and POINT. Check your program listing at the line where the error occurred. What you have is a case of the system being unable to find the sector byte because it got the wrong value someplace. Somehow the POINT value exceeded 125 for single density drives

and 253 for double density drives.

Error Code 167:
File Locked

You've locked the file (either from DOS or using a XIO command) and now you're trying to do something to the file. You can't. Unlock the file and try again.

Error Code 168:
Device Command Invalid

There are three things that will cause this error. To explain this, let's create a file. Type this: OPEN #1,8,0,"D:TEST". Now type: END. Why? I told you the IOCB was open. You just closed it. TEST is now a valid file on your disk. It just contains no data and for our experiments, it doesn't need to.

Type: OPEN #1,4,0,"D:TEST". You have opened TEST for input into your computer. Next type: PUT #1,X. You have created a situation where you are trying to place data into a file that is opened for input only. Type: END.

Now type: OPEN #1,0,0,"D:TEST". You have opened the file, but the system doesn't know what you want to do with it. There must be a 4, 6, 8, 9, or 12 after the first comma of the command. Anything else confuses the issue.

The third thing that will create this error is an illegal XIO call. The Disk Operating System will not recognize any XIO call less than 32 or more than 38. Remember, I said DOS. See the Disk Operating System Reference Manual for more details.

Error Code 169:
Directory Full

There is limited space in the DOS Directory. You are allowed a maximum of 64 files per disk. You tried to save the 65th.

Error Code 170:
File Not Found

The file you are trying to access does not exist on that disk. Which means you have the wrong disk or you entered the filename incorrectly.

Error Code 171:
POINT Invalid

You have tried to use NOTE and POINT to get data from a file you have opened for output (from the computer to the disk). That's a no-no and consider yourself properly punished.

Error Code 172:
Illegal Append

There are now two versions of Atari DOS, DOS 1 and DOS 2.0. Using DOS 2.0, you cannot append a file to a DOS 1 file.

Using DOS 1 you cannot append a file, period.

Error Code 173:
Bad Sectors at Format

Your disk cannot be formatted because of bad sectors. Sometimes you can retry the format and get it to work. However, if the disk is flawed you run the risk of losing data later.

If you continually get this error, it could mean there is something wrong with your disk drive.

Thus ends our series on Error Messages. Hopefully, I have given a better insight on what those numbers mean. There will be a test on Friday.

TRUEHART OF THE CIO

Episode I: The Perils of Pokey

by Léo G. Laporte

McGinty had been running down the long, hot corridors of the data bus for hours, and the exhaustion was beginning to show in his stride. Suddenly, he crumpled into a ball on the floor, the dying echo of his footsteps fading into the silence of the deserted hall. A second passed, then another. The low thrumming pulse of his pursuers' steps grew louder ... then fainter, as they turned off toward another part of the Mother Board in search of him. Finally, the hall was quiet, except for the sound of McGinty's racked breathing.

After a moment, he struggled to his feet. Warily, he began to walk down the hall. The Personality Board lay just ahead; in it were the offices of the CIO, and Jack Truehart. Truehart had to know; everything depended on it.

Step by step, McGinty grew closer, his sharkskin suit glowing an unearthly blue in the hall's dull light. All at once he stopped and sniffed the air. His nostrils flared with apprehension. Suddenly, a huge crackling red sphere of static electricity roared around the corner ahead.

"No!" the man shrieked, and turned to run, but before he could take a step, the field caught up with him and threw his body against the wall with bone-cracking violence. Pinned helplessly, he felt the sphere begin to squeeze the life out of him.

It was over in seconds. McGinty's body slumped lifelessly to the floor like an abandoned marionette. The killer sphere retreated down the pathway, its shimmering red form shrinking away to the size of a firefly's tiny glimmer, then disappearing altogether, leaving only McGinty's body and the acrid odor of ozone in the deathly stillness.

A short distance away, in the offices of the CIO, a single light burned in the darkness. Jack Truehart, the stubble of a two-day beard darkening his square chin, sat hunched over his desk. A large map lay spread before him, in his hand a red pencil.

"There's got to be a pattern here, Hube." With a quick sweep, he drew a line from one end of the map to the other. "Clock cycles missing here," he drew a circle. "Unauthorized disk accesses there." Another circle. "Someone else has been using the system. But who, and why?"

Hubert didn't answer. His 4-foot-tall form was leaning motionlessly against the stained couch across the room. He'd shut down his circuits for recharging hours ago, and was oblivious to anything but a direct command.

Jack grimaced, "I wonder where McGinty is. He should have checked in by now. I hope he didn't have any trouble with the POKEY people."

POKEY was a tough area in the northeast quadrant of the Mother Board. Jack had sent McGinty out to

TRUEHART OF THE CIO

Episode I: The Perils of Pokey

by Léo G. Laporte

McGinty had been running down the long, hot corridors of the data bus for hours, and the exhaustion was beginning to show in his stride. Suddenly, he crumpled into a ball on the floor, the dying echo of his footsteps fading into the silence of the deserted hall. A second passed, then another. The low thrumming pulse of his pursuers' steps grew louder ... then fainter, as they turned off toward another part of the Mother Board in search of him. Finally, the hall was quiet, except for the sound of McGinty's racked breathing.

After a moment, he struggled to his feet. Warily, he began to walk down the hall. The Personality Board lay just ahead; in it were the offices of the CIO, and Jack Truehart. Truehart had to know; everything depended on it.

Step by step, McGinty grew closer, his sharkskin suit glowing an unearthly blue in the hall's dull light. All at once he stopped and sniffed the air. His nostrils flared with apprehension. Suddenly, a huge crackling red sphere of static electricity roared around the corner ahead.

"No!" the man shrieked, and turned to run, but before he could take a step, the field caught up with him and threw his body against the wall with bone-cracking violence. Pinned helplessly, he felt the sphere begin to squeeze the life out of him.

It was over in seconds. McGinty's body slumped lifelessly to the floor like an abandoned marionette. The killer sphere retreated down the pathway, its shimmering red form shrinking away to the size of a firefly's tiny glimmer, then disappearing altogether, leaving only McGinty's body and the acrid odor of ozone in the deathly stillness.

A short distance away, in the offices of the CIO, a single light burned in the darkness. Jack Truehart, the stubble of a two-day beard darkening his square chin, sat hunched over his desk. A large map lay spread before him, in his hand a red pencil.

"There's got to be a pattern here, Hube." With a quick sweep, he drew a line from one end of the map to the other. "Clock cycles missing here," he drew a circle. "Unauthorized disk accesses there." Another circle. "Someone else has been using the system. But who, and why?"

Hubert didn't answer. His 4-foot-tall form was leaning motionlessly against the stained couch across the room. He'd shut down his circuits for recharging hours ago, and was oblivious to anything but a direct command.

Jack grimaced, "I wonder where McGinty is. He should have checked in by now. I hope he didn't have any trouble with the POKEY people."

POKEY was a tough area in the northeast quadrant of the Mother Board. Jack had sent McGinty out to

talk to its inhabitants earlier in the day. He was due back at 5 o'clock. It was after midnight now.

Jack opened a drawer of the old oak desk and pulled out a bottle of Jack Daniels. "Drink, Hube?" He laughed to himself quietly, then poured himself a shot. "Guess it wouldn't do your circuits much good, old fella." He tossed it back quickly then grimaced. "Doesn't do much for my insides, either." He glanced over at the cartons of half-eaten Chinese food and shook his head.

"I think I'll go for a walk. Get some fresh air." He stepped through the office door, trotted down four dark flights of stairs, and made his way out the front entrance to the broad, slick surface of the data bus. By day, thousands of bits of data flew down the bus, eight at a time, but now, in the quiet of the evening, traffic had thinned to nothing. The charge of a few stray electrons gave the corridor an electric blue tint. Truehart tried to relax as he breathed the clean, cool night air. The click of his heels on the specially treated roadway sounded like keystrokes from the board above his head. As he walked he thought back to his meeting with OS two days before.

"Jack, we've got a problem."

"What is it, OS?"

"Take a look at these reports from SIO. Someone's been bypassing us. There's a clear pattern here of unauthorized use, mostly during the vertical-blank interval. Whoever's doing this is pretty cagey."

The vertical-blank interval was a break in processing that occurred every few thousand cycles. Everyone took a breather while the artisans in *ANTIC* touched up the screen display. The guys in 6502 appreciated the VBI. They worked pretty hard the rest of the time. But it looked like someone was taking advantage of this break time to do a little computing on

his own. He wouldn't be able to get much done, but added up over a period of hours and days, who knows what could be accomplished?

That was what was worrying Jack when he stumbled across McGinty's body.

"Great arcing flip-flops! McGinty!" He rolled the cold bundle over. "What in the name of Grid are you doing here?"

Truehart pulled a thin plastic card from within his rumpled jacket. "Hubie, Hubie! Wake up. I've found McGinty."

"I'm already awake, Jack," came the robot's reply over the communicator, "I was just cleaning up the awful mess you left behind."

"Plenty of time to do that later, Hube. Didn't you hear me? I found McGinty!"

"Oh, that's nice."

Jack could hear the crumple and crackle as Hubert compacted and incinerated the Chinese food cartons. "Hubie, save the sweet and sour shrimp!"

"Too late, Jack. But you know it's no good for you. Why you eat this stuff is beyond me."

"Rats! Hube, just reboot McGinty for me, and hurry!"

"Right away, JT."

Jack could hear the beeping of McGinty's program loading. Seconds later the sharkskin covered bundle at his feet began to rise like an inflating balloon, and soon, a vacant, but relatively human face grinned at Jack and said, "Hi."

"McGinty. What happened?"

"Don't remember a thing, Jack."

"Blast."

McGinty's circuits had been wiped clean as a blackboard on the first day of school. Questioning him about the POKEY people was useless. But Jack now knew one thing: whoever was making use of the computer was very anxious that no one catch on, and the trail led straight to POKEY.

"McGinty, you'd better head home. I won't need you anymore, tonight."

"Right, Boss." McGinty shuffled off, toward his address in RAM Estates, still grinning brainlessly. Jack switched on the communicator again.

"Hubie, I'm going to take a walk. I'll see you in the morning."

"Jack, you forgot your raincoat. It might rain. Shall I..." Truehart clicked off the communicator and stowed it in his pocket before the robot could finish. "I'm going to have to get him reprogrammed one of these days," he muttered, as he headed north, toward POKEY.

POKEY was the toughest neighborhood on the whole Mother Board. The POKEY people were only three feet tall, but they were built like oxen. All input into the computer was onloaded by the POKEY people, and years of manual labor had left them looking like miniature Incredible Hulks — that is, if you could overlook the fur. But what was most curious about these tiny people was that they had singing voices of ethereal beauty, and they loved to harmonize. It was like finding the Mormon Tabernacle Choir in a Neanderthal cave.

Jack could hear the music as he walked toward POKEY. It came in waves, first sweet and clear, then harsh and distorted. Up and down the scale they sang, the highest note five and one-half octaves above the lowest. Two more steps and Jack Truehart turned the last corner of the data bus to face POKEY.

The chip was huge. Out from one side ran a line to the serial port, beside it, the lines to the keyboard and the paddle controllers. These thick cables were the connection between the Mother Board and the outside world. Along the other face of the chip ran the data and address buses, along which ebbed and flowed the vast quantities of information generated by the system.

Inside the chip were the great choir halls, four each, where the POKEY's made their music. Also inside, timers to regulate every activity on the Mother Board, and, in an office buried deep within POKEY, the random number generator. Each of these rooms and halls were staffed by the POKEY people.

Jack took a deep breath and stepped through the double doors of the data bus, into the chip itself. The din of thousands of POKEY's singing and laboring, shouting and straining, nearly deafened him. He clung to the wall, battered by the noise and confusion before him.

After a moment he began to catch his breath and noticed that he was standing on a platform that looked out onto a great hall. Below him the POKEY's had formed a bucket-brigade-like line along which passed the sparkling green and blue data bits as they came in from the serial port, 10 at a time. The first bit seemed a signal to the workers below that data was on the way. They redoubled their efforts and pulled in the eight data bits that followed. After the last data bit, one last bit straggled in, as if to signal the byte's end. This entire process was accompanied by loud beeps of

"We're patriots here, buddy, and don't you forget it."

effort from the laboring POKEY's. The 10 bits were gathered at the back of the room. There, still more POKEY's lopped off-the start and stop bits, and bundled up the middle eight into a single byte-sized package, which they sent up a conveyor belt to an opening just below Jack's feet. From there, he knew, it would be sped down the data bus to a holding area for processing. This entire process took only milliseconds and continued ceaselessly before Jack's amazed eyes. In fact, he was so engrossed in their labors, he hardly noticed the security POKEY that was jabbing at his knee-caps with a sharp stick.

"Hey you, I'm talkin' to you, Buster! What are you doin' here?"

The little man kept up the jabbing and Jack was getting more than a little annoyed. He pulled out his billfold and flipped it open.

"Jack Truehart, CIO. I'm investigating a complaint of unauthorized use. And stop poking me!"

"Unauthorized use! Are you insinuatin' that a POKEY would take advantage of the system? We're patriots here, buddy, and don't you forget it. Besides, who has time? We've got work to do. Not like you sniveling layabouts in the OS. I'm runnin' you in for a 202: Aggravated Snoopiness With Intent To Insult. C'mon with me."

The little creature started waddling down the corridor. Jack turned and began to go in the opposite direction. He didn't get very far. The POKEY had been watching out of the corner of his eye.

"Resist arrest, will ya! Get him boys!"

To Jack, it seemed like a hundred furry bowling balls had dropped on top of his head. Within seconds he was trussed up like an Easter ham and riding on the shoulders of a half dozen POKEY's. They were cheering and jeering, in their bizarre way, as they carried him. Walking ahead, the constable POKEY brandished his stick in the air and sang.

Fleshy meat, strong and sweet,
Home-brewed ale, dark or pale,
Round the table the POKEY's meet,
To laugh and sing and share a tale.
To our kitchen we bring a feast,
A tall and dark and vicious beast,
We'll slash him and bash him, 'til he gives up the ghost,
Then into the oven, for 10 hours he'll roast,
Fleshy meat, strong and sweet,
Tonight the POKEY's will devour a treat!

Jack was beginning to wish he had stayed at home, after all.

(To be continued)

The process of writing a video game can be an exciting and challenging proposition. Not only is it necessary to develop an idea but one must also program a computer to execute the commands. This article will describe the process of translating ideas into a working Atari program. Tic-Tac-Toe was chosen so that the process could be explained as simple as possible.

Tic-Tac-Snack is a simplified version of Tic-Tac-Toe. There is one minor change: the traditional X and O are replaced with an apple and chocolate chip cookie.

Each player types the number of the square he wishes the apple or cookie placed into. The player's number and symbol name (our apple or cookie) appear in the text window indicating whose turn it is. If a player chooses a box that is already occupied, the computer will ask him to choose again. Three things occur at the end of a game: the players' score is shown; a running total of games played is displayed; and the players are given the opportunity to begin a new game.

Beginning Your Program

The first step in writing any program is to organize your ideas. Few people enjoy the tedium of flow charting, but it is an integral part of program design. Some people are talented enough to program from "scratch," but I have found that time set aside for planning and organizing can easily save hours of work.

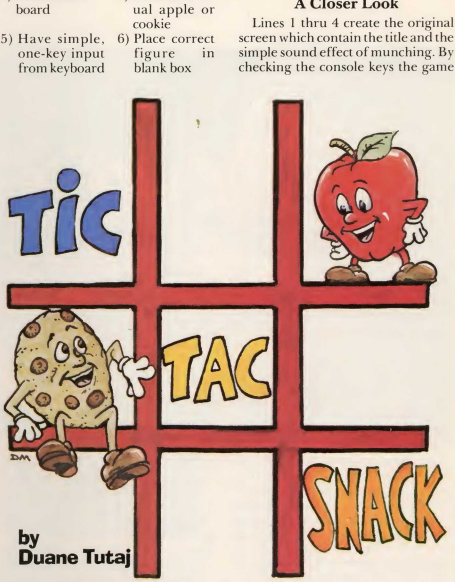
Whether you write an outline, a detailed flow chart, or a list of modules, organizing your program will help the flow of your program and will also simplify debugging it. Good organization also makes it much easier to change your program with a minimum of hassle.

Now, let's talk about *Tic-Tac-Snack*. I wanted to write a Tic-Tac-Toe game but wanted to use something a little less drab than the traditional X's and O's. To show off the Atari's graphics and colors, I decided to substitute apples and cookies. Everything else about Tic-Tac-Toe remains the same.

Here is a list of the modules needed to — or sections to — create *Tic-Tac-Snack*:

1) Instructions
2) Title screen
3) Draw blank board
4) Draw individual apple or cookie
5) Have simple, one-key input from keyboard
6) Place correct figure in blank box
7) Check for correct input and keep score of results
8) Check after every input and see if game is over
9) Design end screen over and ask for replay
10) Program appropriate sounds.

By listing the program objectives, the problems I would have to solve in order for *Tic-Tac-Snack* to work are clarified. By visualizing the end product, I could begin programing the individual modules. Remember, the solutions to each of these problems represent my programing approach. Yours may be entirely different, yet just as functional.



A Closer Look

Lines 1 thru 4 create the original screen which contain the title and the simple sound effect of munching. By checking the console keys the game can begin with a simple press of the start button.

After this is done, the program prints a short screen message and then initializes all the variables and reads in the machine-language subroutines that will be used to draw the board, apple and cookie.

While images could have been plotted and drawn to in the Graphics 7 mode, I felt that that process would be too slow. Instead, I used a public-domain utility to draw rectangles of different colors and another utility to

flip the images using string data. These machine-language routines are placed in strings I1$ for the first image and I2$ for the second image. The routine for flipping the images is in E$ and the rectangle routine is in R$. (These routines are between lines 50 and 865.)

With the rectangle routine uses a USR with the following conditions: (R,Y,X,width,height,color) R is the address of the string R$; Y and X are the starting screen coordinates; width and height are how many bytes of data you wish to draw; and color is one of the four colors in Graphics 7. The numbers 0, 85, 170, and 255 provide a solid color while any other number to 255 will create a stripe effect.

The routine to flip the images is similar. The condition is USR(E,X,Y,I) where E is the address of string E$, followed by the upper left-hand coordinates of the box of data to be flipped. This routine will flip a box of data 5 bytes wide (20 pixels) by 12 lines high. (This requires 60 bytes of data per image.) I is the address of the String I1$ and I2$ which are the images for the apple and the cookie. Use the same type of color data numbers that were used in the rectangle routine for solid colors or stripes.

Up to this point, we've created the title screen and have pinned down a couple of graphic routines. The next step is to open the keyboard for input and set the background color to black (poke 710,0) and turn off the cursor (poke 752,1) in lines 10 thru 45.

You may have noticed that *Tic-Tac-Snack* jumps through several of the routines. The reason is that the for-next loops execute faster at the beginning of a program. Starting the main loop at line 2200 will give more area to work with as the rest of the logic for this program is developed.

At line 2200 the main loop starts. From here, the program returns to line 900 and the rectangle routine draws all the squares. The colors of the borders and background are changed as well. Starting at line 954 the numbers of the boxes are plotted and drawn. Then a quick check is implemented to see if any boxes contain a previous input. If so, that box is filled with the correct symbol and the next box is checked. After each square has been checked the program returns to the main loop.

The current player is given an option of which square he wishes to fill. After his input, a check is made to see if that box is already occupied and whether the key pressed is between 1 and 9. Assuming that the square selected was unoccupied, the correct symbol is flipped to the screen with a calculation that jumps the program to the correct line between 1000 and 1109 (which draws the symbol on the screen). Next there is a check to see if a winning combination is present. If not, the square chosen is also placed in an array for future checking to determine which squares remain open for use. The player number is changed to the opponent and the main loop starts again.

When a correct combination is found, or when all the squares are occupied, a message is printed to the screen and a sound is executed. This is followed by a new screen which shows the total score between the two opponents. A choice is also given to start again, change players or quit.

As you can see, once the decisions were made on how to flip the apples and cookies, it became very easy to program the remaining logic. Again, the importance of flow charting beforehand cannot be over emphasized!

How you go about the individual steps of programming each line and which techniques you use will depend on your background and creativity. There are numerous ways of producing screen colors, but it will be your decision to choose one method that successfully fits in with the other elements of your program.

Finally, it's important to realize that you can only design what you are capable of programming. Once one programmer demonstrated the Space Invaders graphics technique, many other programmers experimented until they too could do the same; and some even improved on the original. Remember, your Atari will only do what *you* program it to do. Your Atari does not know its own limitations: the limitations are your own. By reading, examining, and experimenting, you can develop new and exiting combinations of programming techniques.

Now for that graphic adventure game...

Some Assembly Required

by Robert Peck

This month's column provides a program designed for a bulletin board. It is used to determine if the messages left on the board contain any language the computer bulletin board owner might find objectionable. He may then decide not to accept the message, or perhaps to hang up on the caller, or simply use the output from the program to signal the system operator (SYSOP) that something questionable has just come in.

The reason I have published this program here is it uses several features I will be explaining in future columns. The primary feature is the way parameters are passed to and from Atari BASIC. This will be the topic of the next column. Another feature is the exclusive use of fully relocatable code. (This means no matter where it is placed in the memory, it still does the same job.) This too will be a topic of a future column.

How this Program Works:

The user saves some space for a string in his program, here called E$. It needs only 180 locations maximum. Then another string is defined called A$ (you can have many of these as you will see below). A$ contains, in all capital letters, the definitions for all of the words you might find objectionable or word combinations, such as:

BADWORD or BAD-WORD or BAD WORD

The individual word combinations are separated, in A$, by an exclamation point (!). The maximum length of A$ is 255 characters, including the leading and trailing dollar-sign ($) which tells the machine language program where the string ends. The leading dollar sign is only a space holder but must be there.

B$ is a string of up to 255 characters given to the program, along with its length. B$ will be modified by the program by squishing all of its printable characters (ATASCII values 32 thru 127 only) into a row, and then making the scan for objectionable words. The revised length of B$ is returned as the first character of A$, so that is why there must be a spaceholder in

```

the first character.

If an asterisk (*) represents a nonprintable character, such as a line feed or other cursor move, then the string: "This is a sneaky B****A***D**word" will become: "This is a sneaky BADword**D**word." When all of the nonprinting characters are removed, ASC(A$(1,1)) will show a value of 25 instead of the original string length. If "BADWORD" was in A$ somewhere to begin with, the value of X will point to the first character of that word in A$. Otherwise X will be zero if none of the bad words are found.

All letters are capitalized inside the compare routine before the compare happens, but the source string "case" is not changed.

Those users who have abused the bulletin board privilege also may read this and find creative ways around it. I hope this at least provides a building block others can use for future enhancements.

By the way, as a comparison to BASIC, the original version of this routine, in BASIC, took about 15-20 seconds to process a 200-character input line against a set of 20 bad-words. This version takes less than one second to operate.

Advanced User Forum

by Russ Wetmore

A number of you have asked me to explain further how I use an assembler, rather than just which one. I personally use the *Atari Macro Assembler*. I have logged thousands of hours of work using *AMAC*, although it is not flawless, it does a pretty good job. In this three part series, I will try to explain several of the less used or misunderstood commands, show you how some of them can be used in your programming, and even clue you in on some features not mentioned in the manual. In addition, I'll show you my macro library and how to use it.

One quick note: although this series is aimed at *AMAC* users, several of the concepts will carry over to other macro assemblers, such as *MAC/65* and *ATMASD*.

Commands with Problems

Some *AMAC* commands just flat out don't work. Why they don't is a mystery to me. Any substantial piece of software like *AMAC* (especially software designed to be used for program development) should at least work as outlined in the manual. The first time I used *AMAC* it was a little disheartening to type the examples shown in the documentation only to find they didn't work. One would think they would have at least left the questionable commands out of the manual.

One such command is USE. There are many applications where the USE command would come in handy. It is supposed to be used to designate "consecutive pieces of code in discontiguous source segments." What this means is you can write several sections of your program together in one place that will end up in different areas of memory. I know that you can simulate this by brute-force ORGing your program, but the assembler should be able to do this without having to keep track of absolute addresses. Luckily, you can simulate USE using macros (more on that in the next installment.)

One command that works after a fashion but not as advertised is LIST. In particular, the LIST * function won't perform as stated in the manual. The idea is to be able to "pop" a stack of parameters for the LIST command, and to return the LIST parameters to what they were before the previous LIST command. This would be useful for conditional assemblies where you can control what gets printed based on, say, a value assigned to a label. You might not want to have a data table printed out each time you assemble, for example. It would be nice to be able to say "Go back to what you were doing before," in case you couldn't be sure at a point in the program just what the LIST parameters were.

The only fix for this is to manually keep track of what LIST parameters you are using in all modules. I use lots of IF ENDIF blocks in assemblies to give various listing formats depending on a preset variable.

VFD is a useful command for building data tables where the arbitrary 8-bit "byte" boundaries don't apply. For example, I needed to compact screen images because of their restrictive size. The plan I hit on was this. More than 50% of the data fell into one of four categories:

```
1 byte of $00
2 bytes of $00's
1 byte of $FF
2 bytes of $FF's
```

You can represent those four patterns in 2 bits. Anything else would be represented by the byte itself, 8 bits. I needed a "flag" bit also, to let me know what kind of data was involved — compacted pattern number or byte data. I designated that a 0 bit would mean the next 2 bits that followed represented a pattern number. A 1 bit would mean that the next 8 bits to follow were absolute data. This scheme allowed me to compact my data tables into an area about 60% of their original size.

```
VFD format is:
VFD total\data
[,total\data...]
```

where total is the size of the data that follows in number of bits. *AMAC* keeps assigning bits sequentially until it fills out a byte, then starts on the next one. So, for example,

```
VFD 7\$23,9\$1E3
```

breaks down to:

which is the same as saying:

```
DB $47,$E3
```

except that the VFD construct more clearly shows the nature of the data format.

So, in my example above, if I had the following data:

```
$FF,$FF,$3A,$00
```

and 1 and 2 represented the patterns "2 $FF's" and "1 $00" respectively, I could represent it in compacted form in assembler as:

```
VFD 3\1,9\$13A,3\2
```

Trouble is, this only takes up a total of 15 bits. If I have normal data or program following this statement, *AMAC* is supposed to pad the last byte out with zeroes. It doesn't. In addition, since the *P pointer is never updated (the assembler pointer that points to the last bit position used) the next time you attempt a VFD statement, it'll start putting data in the wrong place.

The fix for this is to end each VFD block with:

```
VFD 7\0
ORG *O
LOC *L
```

This assures that the last byte is padded out with zeroes and the pointers are all updated properly.

More Problems

Probably the most infa-

mous problem with *AMAC* is in its symbol table. Its main use, that of being used by the assembler to look up addresses associated with labels, works properly (most of the time) but reference listings often go haywire. *AMAC* is supposed to list only those SYSTEXT labels that are referenced in your program. Not always so. It's supposed to flag you when a normal label hasn't been referenced. Sometimes, invisible labels are printed, and some normal ones disappear. Granted, most of these errors start creeping in when the symbol table starts filling and many people write programs that never overflow the assembler. I do, however, and the end of a long program development is no time to start worrying about errors induced by another program.

The listing functions only seem to want to work with the Atari 825 and Okidata 82A printers. If you use an Epson or an NEC/Prowriter, for example, the listings will be too long for the page. Most people have figured out that Epson will page properly if you specify PS=57 in the *AMAC* command line. However, you won't be able to use the nice PAGE and TITLE pseudo-opcodes to "pretty print" your listings. Jim Nangano of First Star Software has developed patches to *AMAC* to fix this. If enough people are interested, I'll reproduce them here (pending Jim's permission, of course).

Undocumented Features

There are several commands and command synonyms that are not documented in the manual. The most powerful is MSG. The format for the MSG command is:

```
MSG ⟨string⟩
```

where ⟨string⟩ is a character string (if standard text, surrounded by single quotes). You can also include labels and constants, using commas, which are represented by 4 hex digits.

MSG prints a message to the screen during assembly, as well as writing a line to the listing over the code columns. Example: when developing programs, I frequently just include my display list in-line with my program. Since a display list cannot cross a page boundary, I put this in before the display list:

```
IF   LOW * > $100-
       display_list_length
MSG  'Space allocated:
       $',$100-LOW *
DS   $100-LOW *
ENDIF
```

If the assembler has to allocate space for the display list to not cross a page boundary, I get a message like:

```
'Space allocated: $003D'
```

on the screen to let me know there's a gap in the program. You could also use this command to let you know which parts of conditional assemblies were executed, and so on. It can be very useful to let you know what's going on when you compile.

There are two synonyms for existing commands. REPT is the same as ECHO. (I use REPT because it makes more sense to me than ECHO; small point, I agree.) INCLUDE can be shortened to INCL (which I use because it makes for neater listings — the seven letter command plays havoc with tab columns).

In addition, there are several commands that are recognized by the assembler but don't seem to have been implemented. ENTRY and EXT appear to be hooks for implementing a linking system that was never pursued. There are two data-defining commands that seem to produce a pattern of data, but one I can't figure out. They are DBE and DCE. You might try playing around with them to see what they produce.

Why Are You Using This Turkey, Then?

It may seem that I have a lot of gripes with *AMAC*. Well, they're not really gripes as much as "Gee, I wish those features worked better." Even with all of its problems, I still prefer the extra features *AMAC* has over other assemblers. And after using *MEDIT*, I won't use another line editor as long as I live. But even so, I think it behooves anyone who seriously attempts to use *AMAC* to be aware of these problems and of the possible fixes.

Next time, I'll get into how to use many of the more subtle features of *AMAC*, and introduce my theory behind macro construction. I'll give some pointers on how to construct them and some tricks I've learned.

Fodder for Thought

Some endorsements: I have spent the past two months getting to know, and love, a new language available for the Atari from Optimized Systems Software, the *Basic A+* people. It is called *Action!* and it is nothing short of amazing. The compiled code it produces rivals pure assembly language for speed, and doesn't produce near the overhead of a Basic or other language compiler. I used to use Basic for Q&D work. (Q&D stands for Quick and Dirty.) Things like data compacting, data entry and graphics file manipulations, used to get written in slow, methodical Basic. The *ABC Basic Compiler* speeded things up a bit, but it wasn't until *Action!* came along that I really felt like these mundane tasks weren't getting the best of me. For high-level structure and easily edited source code I get very fast, very compact programs. An unbeatable combination.

Endorsement #2: Koala-Pad. For data entry, this is an unbeatable tool. It programs just like two paddles, and can be used for a variety of purposes. Besides entering graphics, you can use it to input data from a menu. (I use it to enter music data for my games.) Using the graphics drawing program that's supplied, you can create very sophisticated pictures for use in your own programs.

As a parting shot, I promised to pass along a useful tidbit of information each issue. I've received more than a few comments from people wanting to know how I managed to get the familiar key click in *Preppie!* without futzing up the display list. Many of you have no doubt seen Basic programs that used display-list interrupts where the whole screen shook when you typed at the keyboard. As a matter of fact, I am typing this article in using *AtariWriter* — and as I type I can see various markers in the text, which are highlighted by players, flash every time I press a key.

Why does this happen? Well, display-list interrupts usually perform a STA WSYNC ($D40A) which in effect shuts off the 6502 until the television beam reaches the right-hand side of the screen. This is done so that colors and other screen parameters can be changed while the beam is off the visible portion of the screen.

Enter the key-click routine. The click sound is performed by pushing/pulling the speaker inside the computer at a given rate. What is the rate? The OS writers thought that the time it takes the beam to draw across the

screen, or roughly 114 machine cycles per line, would make a good interval. So, they did a STX WSYNC, *128 times!* What happens is that a WSYNC may already be in effect when a display-list interrupt kicks in, thus delaying the interrupt by one scan line.

If you have a whole screen of interrupts or your interrupt routines depend on a certain scan-line position, your display may lock up completely. The offensive OS code that does this is:

```
      LDX #$7F
X1    STX CONSOL
         ;$D01F
      STX WSYNC
         ;$D40A
      DEX
      BPL X1
      RTS
```

There are only two solutions. One is to rewrite a major portion of the key-input routine in the keyboard handler. Luckily, the click routine is only called at one spot in the routine, so you don't have to perform major surgery to correct it.

The second approach is the one I use. Ignore the K: handler completely, and monitor CH ($2FC). When you want to create a "click" sound, JSR through the following subroutine:

```
      LDX #$3F
X1    LDA VCOUNT;$D4
                  0B
X2    CMP VCOUNT
      BEQ X2
      STX CONSOL ;$D0
                  1F
      DEX
      BNE X1
      RTS
```

This pretty much does the same thing. VCOUNT is only updated every other scan line, so the sound is a little lower and more hollow, but it passes very nicely for a click. From Basic, you can put this routine in a string, as it is completely relocatable.

The Academic A

by Lloyd Prentice

Many teachers don't like games. On the other hand, many do.

It just goes to show how elusive learning really is. Even the experts disagree on where, why and how it happens.

Take chess, for instance, is it educational? Or is Monopoly, poker or pitching pennies against the school house wall? What about *Pac-Man*, *Frogger*, *MasterType* or *Snooper Troops*? Can it be some games are educational and others not? Or, at least, that some games surpass others in educational merit? And if so, what makes the difference?

These questions are no longer academic. If you've browsed the racks of your local computer emporium lately, you've probably noticed signs of a bear market for shoot-'em-ups and a bull market for educational games. You've seen scores of educational games commanding shelf space. They have big marketing bucks behind them, all carefully designed, packaged and positioned for families with home computers. And soon you'll see more. Move over *Blast'em!* Make way for *Phasor Math.*

The touts from the market research companies are saying that when they look at computer use in the home today, learning is neck-and-neck with entertainment. Within four years, they say, 70 percent of all educational software will be sold for use in the home. When you couple these facts with the widely respected projection that 30 million American homes will have computers by the end of the decade, it's easy to see why the smart money is crowding in on the ground floor.

But this leaves the consumer with a problem. If teachers cannot agree on the educational merit of games, what is a parent or motivated youngster to do? Even if you accept, philosophically, the educational merit of games, how do you choose among the many attractive offerings?

Here are some helpful hints.

To assess the educational virtues of a game you must consider at least three levels — informational content, logical structure and the social context of play.

And, oh, yes, you must decide whether or not the game is fun to play.

At each level you must ask, specifically, what skills or abilities are necessary to win, to what extent these skills or abilities generalize to the larger spheres of life and whether or not these skills or abilities are enhanced through repeated play of the game.

Back to chess. From an informational point of view, chess provides a highly abstracted model of European power politics in the Middle Ages, but not enough facts to get you through a quiz in freshman Western civilization. The social interactions of chess are equally simple minded — dominate or be dominated.

The elegantly simple rules of chess, on the other hand, encourage intricate strategies that demand the utmost in concentration, visualization, search and planning to mount or defend. Nothing is hidden except the strategic intentions of the opponent. Prowess develops through experience and careful study, and the most skillful player always wins.

The logical structure of chess, in other words, is everything. It's difficult to assess how effectively skill at chess generalizes to other domains. But it is often used as a metaphor to help visualize strategic problems in international relations and business. The qualities that make a good chess player are certainly valuable in any endeavor requiring analyt-

ical ability and logic.

Contrast chess with pitching pennies against the school house wall. You throw. I throw. If both pennies come up either heads or tails, you win. If one comes up heads and the other tails, I win — virtually no informational content and little room for strategy. Assuming fair coins, pitching pennies is pure gambling. Lady Luck determines the winner. There's little room for educational experience. The most to learn is a smidgen of probability and how to win or lose gracefully — and maybe something about how to get along with the fellows out behind the backstop.

Let's look at a typical educational computer game from the point of view that we've outlined above — *Gulp!!*, an *EduFun!* game from the Milliken Publishing Company.

Gulp!! is a math game for children ages seven to 12, which provides drills in addition and multiplication at two levels of difficulty and speed.

When the first frame comes up you're underwater, looking at an anchor and a graceful stand of kelp — simple graphics, but effective. A little fish appears frame left with a big fish in hot pursuit. The goal is to answer 20 math problems as quickly as possible. If you make too many mistakes or take too long to respond, it's curtains for the little fish. The big fish eats him — a kind of one-dimensional *Pac-Man*. If you elude the big fish, you are rewarded with a bonus game. You get to cast a hook into shark-infested waters. Using the arrow keys to control the hook, you try to snag as many numbers as you can and bring them to the surface before the white shark eats them. You score 100 times the value of each number you hook.

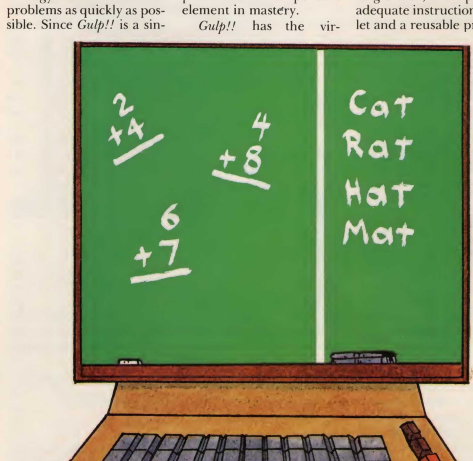
Clearly, the informational content of *Gulp!!* is limited to simple number facts. The game reinforces this, but does not actually teach them. The implicit biology lesson in *Gulp!!* is not significant enough to give a second thought. The logical structure of *Gulp!!* leaves little room for strategy. The only effective strategy is to solve the math problems as quickly as possible. Since *Gulp!!* is a single player game, social interactions do not enter into the picture.

In other words, *Gulp!!* is educationally thin. It is a pure drill without any attempt to make the logic or purpose of the arithmetic operations visible or manifest. Also, it's not clear why subtraction and division modes are not provided. Finally, the skill being reinforced is disconnected from the scenario of the game. For all we know, arithmetic skills are of little survival value to a little fish trying to escape the voracious jaws of a whopper.

But *Gulp!!* is not without redeeming value. Youngsters do have to learn the basic number facts presented in *Gulp!!* and rote practice is an important element in mastery.

Gulp!! has the virtue of motivating the youngster to put time into the traditionally boring practice task. It's a simple, unpretentious game that can be played many times without getting utterly tedious.

When you purchase *Gulp!!*, you also get *Arrow Graphics*, a pattern-making game that teaches problem solving and directionality. *Arrow Graphics* requires the player to decompose a complex pattern into its basic modular elements. The game is not as much fun as *Gulp!!*, but it makes effective use of the computer to reinforce a difficult idea. Well-packaged, *Gulp!!* and *Arrow Graphics* come in a sturdy 7-by-7-inch vinyl binder containing a single disk, a simple, but adequate instruction booklet and a reusable practice/score card. The cost is $39.95.



Gulp!! gives you a good idea of where most educational computer games are today — clever and cute, but one-dimensional. It's not from a lack of care or trying. Simply, the designers are still trying to understand the possibilities of the computer as a medium for instruction.

Strolling Forth

by Stephen Maguire
and Evan Rosen

Let's quickly finish up discussion of the code for last issue's one-player "Dot-Maze" game and then move on to new topics.

On screen 16 last month was the word GET-STICK which stored the horizontal increment read from joy stick 0 in the variable DX, and the vertical increment into DY. (Remember, the increments may be -1, 0, or 1.) Built into GET-STICK, however, is a delay, determined by the variable STICK-DELAY, to slow the Wumpus down when traveling over open spaces in the maze. An open-space move is determined by the logic on line 4, which looks for a stick move in one and only one of the four directions up, down, left, or right, and line 5 which checks to see that the variable WUMPOS is over an inverse-video blank, value 128. The Wumpus is not slowed when running along the diagonal roads.

The word MOVE-OK? on screen 15 picks up the values in the variables DX and DY which are set by GET-STICK and checks to see if they are legal. The 198 and 199 in the definition are inverse video screen codes for 70 and 71. That is, 70 + 128 = 198 and 71 + 128 = 199. If the move is valid, then MOVE-OK? leaves a true flag, which is a 1. Otherwise MOVE-OK? leaves a false flag, a 0.

On screen 17 was PICK-ONE, a handy, random-picking routine which is aided by hardware-supplied random bytes from location 53770, which always provides a fresh random byte. Given a positive number n, PICK-ONE will randomly pick a number from 0 to n-1 and leave it on the stack. PICK-ONE is used in INITIALIZE, also on screen 17, to pick an initial position for the WUMPOS. INITIALIZE also sets the variables STICK-COUNT (the stick delay counter) and POINTS (the score counter) to 0 to clear any data left from a previous game.

The words SHOW-SCORES and FINISHED? on screen 18 are fairly self-explanatory. Remember, if you don't know what something does, like 125 EMIT, for example, you can always try it out.

This issue defines some words which simplify picking up keyboard input from within a running program.

Lastly, the word DOT-MAZE on last issue's screen 19 puts all the previous words together to run the game. Note the check on the value in the key input buffer, location 764, on line 10 of screen 19. This allows ending a game early by pressing any key. If the player wishes to start a new game, pressing the "Y" key will let him exit the present game and then go to a new one as the "Y" is picked up by the word FINISHED?. More on this key buffer in a moment.

This issue's "Snow" game is somewhat representative of FORTH-style coding in general. At the end of the listing you'll find the top word, SNOW, which calls some of the words below it, which in turn call words below them. The words are short, each composed of only about 30 or 40 other words at most, and all words have well-defined tasks which are indicated by the words' names. This is roughly how a program should look. But how do you get it to look this way?

If the programmer already has a precise idea of what a given program has to do, then it is possible to program "top down." That is, the programmer writes out the top word first. The top word will contain many undefined words, and these are defined next. These words will usually still contain undefined words, and the defining process continues down to the level until all words are defined in terms of the original set of words in the FORTH kernel. At this point the program is written and is ready for testing. This "top down" coding style is used with success in much commercial programming and in many languages, FORTH included.

In hobby hacking, however, "bottom up" or "inside out" coding also occurs. For instance, you may program random-number pickers or joystick-reading routines first, just because they happen to be more fun in themselves, or because you don't really know where you're going with the program yet. But eventually, when you have a solid plan in mind for your game (or whatever), make a final pass or two in "top down" style to clean things up. This will greatly simplify debugging, improve clarity and organization and will facilitate the making of changes later on.

Keyboard Interaction

For our main topic this issue we would like to define some words which simplify picking up keyboard input from within a running program. Restricting ourselves to single key inputs (rather than sequences or "string" inputs), we can still distinguish at least two different types of keyboard input: "Waiting for a key," and "Looking for a key."

Waiting for a Key, or, "What is your choice, Sire?"

This type of input may be implemented simply using the word KEY. KEY enters a loop and waits for any key to be pressed. When one is, KEY leaves the pressed key's ASCII code (or its Atari-modified ASCII code, called ATASCII) on the stack. Very often, a yes-no answer is required from the keyboard and the program prints a question and indicates it is waiting for a "Y" or "N" to be pressed: This happens so often, in fact,

that it makes sense to define a word called Y/N, which can be tacked on after the question string in the word that asks the question.

Y/N may be implemented in many ways. On screens 70 and 71 in this article are two definitions which also illustrate differences between "hobby" or "quick" programming, and more "polished" or "friendly" code. Type in and load the code and type EXAMPLE, which uses the friendly and sophisticated version of Y/N, and note that it will accept only "Y," "y," "N," and "n" and won't let go until it sees one of these.

KEY may also be used to wait for a key that represents a choice from a menu displayed on the screen. That is, suppose we had four options at some point in a game. The code might look like that on screens 72-75. If you edit this into your system and type 72 LOAD (after loading the previous example) and then GAME, you'll get a sample menu.

Of course, this is a simple example, but the words RUN, FIGHT, SPELL and WAIT could have much more complex actions. They might look at some variables which would have information on "who" the enemy was and what "powers" it had, what kind of "power" the player had and how his "luck" was holding out, and so on.

So much for "wait for a key" input. But what if you are programming an action game where you don't want to stop everything while the player ponders a move? This requires getting key input of a different sort.

Dr. Quatro

Looking for a Key

Suppose we want to pick up keys "on the fly" rather than waiting for them. We can't use KEY, which enters its own wait-loop. As it happens, in Atari 400's and 800's, location 764 holds a value, called a "key code," which corresponds to the last key pressed and is not absorbed by the operating system. These key codes don't seem to have any rhyme or reason to their numbering scheme, but still they can be used to identify key presses. Let's define a word to tell us a key's key code when we press the key.

```
: KEYCODE ( — )
  BEGIN 53279 C@ 7
  = 0 =
  UNTIL 764 C@ . 255
  764 C! ;
```

To find the key code of a key, type KEYCODE (Return), then press the key for which you want the key-code, and then press any one of the yellow console buttons, i.e., START, SELECT, or OPTION. (Location 53279 reads the console buttons, but in a slightly involved way.)

To illustrate one use of picking up keycodes on the fly, we'll make up a simple game called "Snow." The code is on screens 76 through 81, and may be loaded independently of the earlier code. For QS FORTH you must also *first* load its I/O package to get the word GR. into the system. For APX FORTH, first load the assembler and then the graphics package, to get GR. in. ValFORTH will load the code without extras. To run the game, type SNOW. The idea is to maneuver the bucket, a "U," under the falling asterisk snowflakes without letting any flakes hit the ground. The bucket is moved by pressing the "F" and "J" keys, which is really the point of the illustration. If you're using APX FORTH, then on successive runs of snow you'll need to say XGR SNOW instead of just SNOW.

Space does not permit a long discussion of the code, but here are some highlights. SNOW starts with an initialization routine and then enters a loop which moves the snowflakes and the bucket, and then delays for a while to slow the process down to human speed. The loop doesn't exit until the variable ?DONE becomes non-zero. This can only happen when a snowflake reaches the ground, which is determined in FALL?. Note the use of the random byte register, 53770, in FALL?, which is used to move a flake only one time in eight that FALL? is called.

And that's about it for now, except for a quick word from Dr. Quatro. Doctor?

Yes, yes, boys. The word is:

```
: BASE36 ( — )
  36 BASE ! ;
```

This little treasure lets us see short strings as numbers. For supposing, we can say now:

```
BASE36 QUA TRO
```

and we will get back "ok" because in base 36 "QUA" and "TRO" are numbers. You see it? And then we can also say:

```
TWA 467 LAX
```

which means Trans World Airliners flight 467, Los Angeles International airport. Yes, it does!

Evan Rosen and Steve Maguire are the creators of Valforth by Valpar Int.

Kids and the Atari from Datamost introduces Atari Basic Programming to children aged 10 to 14. Arranged in 33 lessons, the book contains notes to the instructor or parents, examples, assignments and review questions. This is the second in a series.

Instructor Notes 2

Buzz, Inverse, String Constants

This lesson opens with the CTRL 2 key sequence which makes the buzzer sound. We wish to make plenty of "bells and whistles" available to the student to increase program richness.

The idea of a "string constant," used in Lesson 1, is explained. The numbers appearing in a string, for example the "19," cannot be used directly in arithmetic.

The INVERSE command puts a little pizazz on the screen.

Although the ATARI can print in lower case letters, we will not do so in this book. There are several reasons: we need lower case to indicate special commands like "buzz, inverse, normal, clear" in PRINT commands. The lower case letters are so small that they are not very clear anyway. And it just adds an unnecessary complication. If the instructor wishes to include lower case typing, do so by giving extra explanations, especially emphasizing that "clear" in a PRINT line does not mean type the word "clear," etc.

Questions:

1. How do you do each of these things: Make the ATARI "buzz?" Erase the screen? Empty the memory?
2. What is a "string?"
3. What special key do you press to "enter" a line?
4. What is a command? Give some examples.
5. How could you print "FIRE" in inverse letters and make the computer buzz?

Lesson 2

Buzz, Inverse, String Constants

Enter:

```
NEW
```

(remember: RETURN key)

Then clear the screen (remember: SHIFT CLEAR keys).

You are ready to start this lesson.

Sounding the Buzzer

The ATARI has a buzzer. Use two keys to make it sound.

Hold down the CTRL key. Then press the "2" key.

You hear a loud buzzing sound.

CTRL stands for "control." This key helps control things on the computer. CTRL 2 makes the buzzer sound.

Printing an Empty Line

Run this:

```
10 REM LINES
20 PRINT "HERE IS
   A LINE"
30 PRINT
40 PRINT "ONE
   LINE WAS
   SKIPPED"
```

Line 30 just prints a blank line.

String Constants

Look at these PRINT statements:

```
10 PRINT "JOE"
10 PRINT
   "#D47*%"
10 PRINT "19"
10 PRINT "3,
   1416"
10 PRINT "I'M 14"
```

Letters, numbers and punctuation marks are called "characters."

Even a blank space is a character.

Look at this:

```
10 PRINT " "
```

(Later we will have graphics characters too, and some special characters like "buzz" and "clear.") Characters in a row make a "string."

The letters are stretched out like beads on a string.

A string between quotation marks is called a "string constant."

It is a string because it is made of letters, numbers and punctuation marks in a row.

It is a constant because it stays the same.

It doesn't change as the program runs.

Inside Out Printing

There is a special key on the ATARI computer.

It looks like this:

It is called "the ATARI key."

Press it. Type.

Now all the letters you type are in the "inverse" mode.

Press the ATARI key again. Type.

You are back to normal (non-inverse) letters.

Use inverse to make the stuff printed on the screen look more interesting.

Inverse and Normal In Print Commands

We have a special way of telling you to press the ATARI key.

We will say "inverse" or "normal." It looks like this:

```
10 REM BLACK AND
   WHITE
20 PRINT
   "INVERSE
```

```
WHITE NORMAL
BLACK"
```

This means:
Type:

```
20 PRINT"
```

Press the ATARI key
Type:

```
WHITE
```

Press the ATARI key again
Type:

```
BLACK"
```

Press the RETURN key.
Run the program.

Capital Letters And Small Letters

The ATARI can print in small letters (the ones called "lower case").

But in this book, we will not use any lower case on the computer.

IMPORTANT! Whenever you see lower case writing inside the quotation marks of a PRINT command, it will have a special meaning.

```
20 PRINT INVERSE
```

is not

```
20 PRINT
   "INVERSE"
20 PRINT NORMAL
```

is not

```
20 PRINT
   "NORMAL"
```

We saw one special meaning above with the ATARI key. Here is another.

The ESC Key

Find the ESC key. It is in the upper left corner of the keyboard. ESC is short for ESCAPE.

This key helps us give special instructions like "clear" and "buzz" to the computer.

Whenever you see "clear" in a PRINT command, do this:

Press the ESC key once.
Then hold down the SHIFT key and press the CLEAR key. Got it?
Enter:

```
10 REM SPECIAL
   PRINT
20 PRINT "CLEAR"
30 PRINT "CLEAN
   SLATE"
```

Of course you do not see "clear" in line 20. You see a funny bent arrow instead.

Whenever you see "buzz" in a PRINT command, do this:

Press the ESC key once.
Then hold down the CTRL key and press the 2 key.
Add this:

```
40 PRINT "BUZZ"
```

Of course, you do not see "buzz" in line 40. You see a funny inverse bent arrow instead.

Run the program. It should clear the screen, print CLEAN SLATE, and sound the buzzer.

Assignment 2:

1. Write a program that prints your first, middle and last names. Make the first and middle names in normal letters, and the last name in inverse letters.
2. Now make the program clear the screen before writing anything.
3. Now make the buzzer sound before printing each name.

Perspectives

Oh, Those Dreaded Computers

Even though computers are increasingly important in most aspects of life, nearly a third of all people are afraid of using them, a university researcher says.

About 30 percent of adults suffer from cyberphobia, or fear of computers, said Abraham Kandel, Florida State University computer science department chairman.

Courses to combat cyberphobia are necessary, he said, because computer experts have so far failed to educate the public about some of the advantages of the technology.

"In the early part of the century, there was a fear of telephoning," Kandel said. "Later, there was a fear of flying.

"Now, (we have a) fear of computing."

-JBII

Better Learning

A recent study by Program Design Inc. indicates preschool children can increase their learning skills at a much earlier age than previously thought — through the use of computers.

Twenty 3-and 4-year-olds, all from the same socioeconomic background in Connecticut, were chosen for the study. The group was divided into two sections, half studying with the aid of educational software programs produced by PDI, and the other half serving as a control.

"The children working with computers made a substantial gain of 47.4 percent, while the control group gained only 13.5 percent," said John Victor, president of PDI.

With the assistance of computers, the study found the children increased not only their reading skills, but also advanced their confidence level and ability to make decisions, Victor said.

"Computers are especially effective with children at the early stage of development," he added. "For one thing, they really enjoy working with them. It seems more play than work."

-JBII

Fun And Games

Fun and learning need not be opposites, according to Atari Inc., which recently opened a unique learning and entertainment center in St. Louis.

Called Atari Adventure, the center offers something for just about everyone. It features a hands-on Computer Learning Center with a full-time instructor in addition to a high-tech video game room. The center also includes a special display area where visitors can "touch tomorrow" through the latest in video game technology.

The Computer Learning Center is an eight-station classroom setting with an extensive software library, including word processing, Visicalc, programming languages and, of course, games.

-JBII

Holy Video

Amen.

Video game cartridges based on Bible stories have joined the ranks of computer games, with several already introduced during the past nine months.

While the Bible lessons show no indication of threatening the likes of Pac Man and the rest of the bunch, the games' producers hope the Bible versions will catch on with churches.

-JBII

Warner Loves First Star

Warner Software Inc., the recently-formed subsidiary of Warner Publishing, has acquired a substantial interest in First Star Software, Inc., designers and publishers of computer software.

Under terms of the agreement, First Star will continue to operate independently — but supported by the additional strengths, business experience, and publishing, marketing and distribution resources of Warner.

-JBII

Tune In To This

Atari Inc. and Activision Inc. have formed a joint venture to broadcast video games to households.

The companies will introduce the service commercially during the second half of this year.

An unspecified type of broadcast technology will be used to transmit the games to a home receiver that plugs into a video game player. Initially, however, the service will play only on the Atari 2600 player or compatible machines.

The venture should provide game manufacturers and retailers with a gauge as to what games are popular.

-JBII

Back Space

For All Readers

I have just finished reading the first issue of Hi-Res Magazine and am elated that someone has finally published a document that dummies like me can read and understand. All the articles started with the basics and fully explained any technical jargon. This is the kind of stuff that the majority of us out here are hungry for. I, for one, think your magazine will do very, very well if you keep on your present course.

Of course you're not perfect yet. May I suggest the following:

1) The more good utility and game programs you can supply, the better. 2) Differentiate between the zeros and the "Os in program listings. 3) Publish a list of typing conventions for CNTL and ESC symbols etc. 4) Proof-read and run your programs. I tried to type in the program but had to give up on it. 5) Something you seldom see in computer oriented magazines are construction projects. Most home computer owners are probably not experimenters but most experimenters probably own a home computer. Many of us would like guidance on building interfaces, printer buffers, power supplies etc. Keep up the good work. I'll be looking forward to the second issue.

— CHESTER HARBIN, Valparaiso, FL

★

I am an avid ATARI fan and ATARI 800 computer owner. I was thumbing through the magazine shelve for the latest issue of COMPUTE! or A.N.A.L.O.G., when the Premiere Issue of Hi-Res caught my eye. I decided to give it a try. The scrolling color machine language routine itself was worth the $3.00 cost of the magazine! The history of Atari Inc. was veryinteresting and I would love to know how the Atari 400-generated image of Nolan Bushnell was accomplished. Also, thanks for the article on Bill Hogue and Miner 2049, which I plan to add to my software library in the near future.

— WAYNE GAUTNEY, Mobile, ALA

★

Your magazine is great. I'm an Atari Club Member. Hi-Res tells me about Atari's computers. I love your magazine. I might subscribe.

— JOHN F. DIMITNOFF, Orange, CA

★

Explanations Needed

My interest lies in learning advanced graphics, techniques in BASIC, and in learning assembly language (at which I am a beginner). In your premiere issue, you showed a short assembly program (p.71). Please explain everything you're doing, line by line — not just with the REMARKS (comments). I like the other articles, too; and the magazine looks great!

— M. TORRONE, Kent, WA

★

Impressive amount of big name contributors. Needs authors among "common folks." Very varied and could use more technical materials and programs.

— ANDREW KATZ, Little Ferry, NJ

★

Shape Up

I hope program listing is not an example of future Hi-Res listings, as there are approximately 20 characters missing!! If your listings cannot be more accurate, I'm sorry I subscribed to this magazine!

— JASON SCHENZEL, Schofield, WI

★

A Bit Advanced

I liked all of the columns and what each was to cover. Need a column for beginning computer users.

— WESLEY TURNER, Tempe, AZ

★

A Bit Elementary

The magazine is pretty good. Personally I find the articles too elementary, but then I am a software engineer professionally.

— ROBERT F. SADOWNICZAK, Daytona Beach, FL

★

However...

I find that there is both general and advanced articles which is good because it interests all groups of users.

— SEAN BINKLEY, Ontario, Canada

★

A-Ok

Just right! I am especially excited about articles on Assembler by R. Wetmore and Robert Peck. My subscription order is enclosed.

— RONNA CEKINOVICH, Rockford, IL

★

The Perspectives column is great!!! I like the Reviews a

Terre Hauk, IN

★

Want More...

Like to have a listing of what is available on cassette, disc and cartridge for Atari (800) by Atari or any other popular company, average price, and rate them by graphics, colors, difficulty and show graphics.
— ROB KUTCH,
Robbinsville, NJ

★

More programs, more information on Atari compatible hardware/software. Here's my check, you done good!
— D.C. DOHERTY,
Olympia, WA

★

Please more programs we can enter. I'm a novice and the articles on Error Messages & Graphics Modes turned on a light for me. More! More!
— CAROL M. CRENSHAW,
Cuyattoga Falls, Ohio

★

Not Up-To-Date

Jeez, guys! are you living in the 19th century? Saying that Dig Pub is about to be released which I bought five months ago isn't what I call up-to-date facts. And, about your facts — so, Atari made the coin-up defender. Boy, could have sworn that Williams made that one. Guess they didn't, even though their name is written all over the machine! Honestly, I'm not a critic, but I'm only 11 and I know more facts than you do! Dig Peeper, Fellas. I'm not angry, just discouraged that you people don't have your facts straight. I'm sorry, but until those facts are fixed, your magazine is just a big disappointment to me.
— CHRISTOPHER MOLANPHY,
Brooklyn, NY

★

Your "Reviews" are great! How about some articles on peripherals?
— ANGEL TRUE,
Longwood, FL

★

If the quality continues as in this issue or gets better, you can only have success!
— KENNETH SUZUKI,
Montgrey Park, CA

Of References

I loved your magazine! It was informative and enjoyable. I used it for my school project on "Video games"
— LAURIE LOCASHIO,
Winchester, MA

★

Sorry, but...

I enjoyed your first issue. It was very informing. But, I have no intention of buying one of Atari's computers. You see, my school was promised by Atari to receive free Atari computers. But, that was quite a while ago. My school is: Isaac Bildersee J.H.S. 68, Brooklyn, NY.

I am going to get a Commodore 64 computer. It is more efficient.
— HELEN COULTON,
Brooklyn, NY

Letters to the editor should be addressed: Back Space, Hi-Res Magazine, 933 Lee Road, Suite 325, Orlando, FL 32810. All letters should include the writer's full name, address and home telephone. Letters may be edited for purposes of clarity or space.

Previews

Right Stuff with Solo Flight

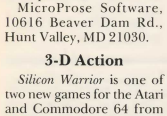
Grab your helmet and flying gear, and get ready to show your "Right Stuff" with *Solo Flight*, an exciting and realistic three-dimensional flying simulation for the Commodore 64 and Atari computers from MicroProse software.

Solo Flight, a flight simulator for home computers, combines the excitement of flying by accurate simulation with the thrill of accomplishment in overcoming the dangers of rough terrain, bad weather, and mechanical and instrument failures. Suggested retail price is $34.95.

MicroProse Software, 10616 Beaver Dam Rd., Hunt Valley, MD 21030.

3-D Action

Silicon Warrior is one of two new games for the Atari and Commodore 64 from EPYX. In this three-dimensional game, characters disappear and reappear, making this a very special action/strategy game.



Silicon Warriors

In *Pitstop*, the player controls his racing car with steering and speed controls. In order to win the race, the player must decide if a pitstop is necessary and when to make it.

EPYX, Inc., 1043 Kiel Court, Sunnyvale, CA 94089.

1 + 1

Success with Math, from CBS Software, is a series of math review programs designed to help the student learn and practice math skills at his own pace and allow him to choose the number and difficulty level of the problems he wishes to solve.

The classroom-tested programs take the student, step-by-step, through arithmetic and algebra concepts. They are encouraging, never judgmental, simple to use and require little or no use of printed material. Suggested retail prices are $24.95 for disk and $19.95 for cassette.

For more information contact Schwartz Public Relations Associates, Inc., 183 Madison Ave., New York, NY 10016.

Secret's Worth $10,000

Hop along with *Pogo Joe* as he bounces across fields of cylinders to escape his foes. Travel with Pogo to the 10th screen to find the secret word which could win you $10,000 in cash!

In *Asylum* you are confronted with wacky inmates and mysterious obstacles as you struggle to escape the grueling maze. Can you keep your sanity while seeking the answer hidden in the mirror of *Asylum*?

Pogo Joe is available in 48-64K on the Atari for $24.95 and *Asylum* in 48K for $29.95.

For more information contact ScreenPlay, P.O. Box 3558, Chapel Hill, N.C. 27514 or call 1-800-334-5470.

Pooyan

Pooyan Adapted for Commodore

Pooyan, the quick-reflex, fast-thinking action game where hungry wolves hunt defenseless piglets, has been adapted for the Commodore 64 home computer by Datasoft, Inc.

Featured with high-resolution color graphics and multiple screen scenarios, *Pooyan* can be played by one or two players. Available on disk and cassette for the Commodore and Atari, *Pooyan's* suggested retail price is $29.95.

Datasoft, Inc., 9421 Winnetka Ave., Chatsworth, CA 91311.

New Levels of Adventure in Vanguard

Attention space pilots: Looking for new frontiers of adventure? Join the expedition through the tunnels of planet Aterria, find the fabulous city of Mystery and destroy the great Gond in *Vanguard*, the recently introduced video game from Atari.

Vanguard is available for the 2600 VCS console at a suggested retail price of $30.45 and for the 5200 Supersystem, $40.95.

For more information, contact Atari, Inc., 1265 Borregas Ave., P.O. Box 427, Sunnyvale, CA 94086.

Prophecy is with You

The Prophecy is on your side in *Krull*, recently introduced by Atari.

The land of *Krull* has been plunged into darkness by the Beast and his army of marauding Slayers. Hope lies in The Prophecy, which says Prince Colwyn shall rule the planet. But the marriage ceremony uniting Colwyn with Princess Lyssa is tragically interrupted by the Slayers and it is up to you to free Lyssa from the Black Forest.

Strength and courage are needed to succeed in this perilous journey, but remember: The Prophecy is on your side.

Atari, Inc., 1265 Borregas Ave., P.O. Box 427, Sunnyvale, CA 94086.

Journey into Space

Space Shuttle, designed by Steve Kitchen, transforms the Atari 2600 into an orbital voyager. From Florida liftoff to California touchdown, the player-pilot experiences firsthand an actual NASA Shuttle flight.

The mission is clear and vital. A satellite, 210 miles

above Earth, is spinning out of orbit with intentionally programmed gyroscope problems. At the helm of Space Shuttle Discovery, the player must launch, rendezvous and dock with the errant satellite, then return safely to Earth. Suggested retail price is $34.95.

Activision, Inc., 2350 Bayshore Frontage Rd., Mountain View, CA 94043.

It's Magic

Sorcerer's Apprentice, recently introduced by Atari, captures the magic and fantasy of the Walt Disney movie, "Fantasia."

Featured with colorful graphics and music from the famed film, this skill and action video game finds Mickey Mouse up to his ears in magical mischief. Designed for players 5 years and older, *Sorcerer's Apprentice* retails for a suggested price of $30.95.

Atari Inc., 1265 Borregas Ave., P.O. Box 427, Sunnyvale, CA 94086.

Drol's Toll

Complete with sound effects and an original theme song, the players of *Drol* take on the task of pursuing a little girl and her brother who have wandered away from their mother.

If you're successful in reuniting the children with their mother, you will be rewarded with an endearing cartoon. *Drol* is available on disk for both Atari and Commodore 64. Both versions have a suggested list price of $34.95.

Broderbund Software, 17 Paul Dr., San Rafael, CA 94903.

Which player is really firing up his score?

Think quick. The new home version of Moon Patrol looks so much like the arcade, it could fool the man in the moon. So don't find yourself in a crater. Like the player on the right. He'll get only 100 points for using his Moon Buggy to shoot down a Moon Strafer. While the player on the left will get twice as many points for shooting down a Crater Maker. A victory as great as the lunar landing.

Your score can wax even higher. You'll get 80 points every time your Moon Buggy jumps over a rock. But you'll get 100 points when you blow up a rock.

Only Atari makes Moon Patrol for the ATARI® 2600™ Game, Sears Video Arcade† systems, and a version exclusively for the ATARI 5200™ SuperSystem.

So get on your lunar module and scan your local moonscape for Moon Patrol.

Here comes Moon Patrol™ from Atari®.
